# MTConnect® Specification and Materials

AMT - The Association For Manufacturing Technology (“AMT”) owns the copyright in this MTConnect® Specification or Material. AMT grants to you a non-exclusive, non-transferable, revocable, non-sublicensable, fully-paid-up copyright license to reproduce, copy and redistribute this MTConnect® Specification or Material, provided that you may only copy or redistribute the MTConnect® Specification or Material in the form in which you received it, without modifications, and with all copyright notices and other notices and disclaimers contained in the MTConnect® Specification or Material.

If you intend to adopt or implement an MTConnect® Specification or Material in a product, whether hardware, software or firmware, which complies with an MTConnect® Specification, you shall agree to the MTConnect® Specification Implementer License Agreement (“Implementer License”) or to the MTConnect® Intellectual Property Policy and Agreement (“IP Policy”). The Implementer License and IP Policy each sets forth the license terms and other terms of use for MTConnect® Implementers to adopt or implement the MTConnect® Specifications, including certain license rights covering necessary patent claims for that purpose. These materials can be found at [www.MTConnect.org](http://www.MTConnect.org) or by contacting [info@MTConnect.org](mailto:info@MTConnect.org)

MTConnect® Institute and AMT have no responsibility to identify patents, patent claims or patent applications which may relate to or be required to implement a Specification, or to determine the legal validity or scope of any such patent claims brought to their attention. Each MTConnect® Implementer is responsible for securing its own licenses or rights to any patent or other intellectual property rights that may be necessary for such use, and neither AMT nor MTConnect® Institute have any obligation to secure any such rights.

This Material and all MTConnect® Specifications and Materials are provided “as is” and MTConnect® Institute and AMT, and each of their respective members, officers, affiliates, sponsors and agents, make no representation or warranty of any kind relating to these materials or to any implementation of the MTConnect® Specifications or Materials in any product, including, without limitation, any expressed or implied warranty of non-infringement, merchantability, or fitness for particular purpose, or of the accuracy, reliability, or completeness of information contained herein. In no event shall MTConnect® Institute or AMT be liable to any user or implementer of MTConnect® Specifications or Materials for the cost of procuring substitute goods or services, lost profits, loss of use, loss of data or any incidental, consequential, indirect, special or punitive damages or other direct damages, whether under contract, tort, warranty or otherwise, arising in any way out of access, use or inability to use the MTConnect® Specification or other MTConnect® Materials, whether or not they had advance notice of the possibility of such damage.

## 1 Overview of MTConnect®

2 MTConnect® is a data and information exchange standard that is based on a *data dictionary* of  
3 terms describing information associated with manufacturing operations. The standard also  
4 defines a series of *semantic data models* that provide a clear and unambiguous representation of  
5 how that information relates to a manufacturing operation. The MTConnect Standard has been  
6 designed to enhance the data acquisition capabilities from equipment in manufacturing facilities,  
7 to expand the use of data driven decision making in manufacturing operations, and to enable  
8 software applications and manufacturing equipment to move toward a plug-and-play  
9 environment to reduce the cost of integration of manufacturing software systems.

10 The MTConnect standard supports two primary communications methods – *Request/Response*  
11 and *Publish/Subscribe* type of communications. The *Request/Response* communications  
12 structure is used throughout this document to describe the functionality provided by MTConnect.  
13 See *Section 8.3.6 – Data Streaming* for details describing the functionality of the  
14 *Publish/Subscribe* communications structure available from an *MTConnect Agent*.

15 Although the MTConnect Standard has been defined to specifically meet the requirements of the  
16 manufacturing industry, it can also be readily applied to other application areas as well.

17 The MTConnect Standard is an open, royalty free standard – meaning that it is available for  
18 anyone to download, implement, and utilize in software systems at no cost to the implementer.

19 The *semantic data models* defined in the MTConnect Standard provide the information required  
20 to fully characterize data with both a clear and unambiguous meaning and a mechanism to  
21 directly relate that data to the manufacturing operation where the data originated. Without a  
22 semantic data model, client software applications must apply an additional layer of logic to raw  
23 data to convey this same level of meaning and relationship to manufacturing operations. The  
24 approach provided in the MTConnect Standard for modeling and organizing data allows software  
25 applications to easily interpret data from a wide variety of data sources which reduces the  
26 complexity and effort to develop applications.

27 The data and information from a broad range of manufacturing equipment and systems are  
28 addressed by the MTConnect Standard. Where the *data dictionary* and *semantic data models* are  
29 insufficient to define some information within an implementation, an implementer may extend  
30 the *data dictionary* and *semantic data models* to address their specific requirements. See *Section*  
31 *6.7* for guidelines related to extensibility of the MTConnect Standard.

32 To assist in implementation, the MTConnect Standard is built upon the most prevalent standards  
33 in the manufacturing and software industries. This maximizes the number of software tools  
34 available for implementation and provides the highest level of interoperability with other  
35 standards, software applications, and equipment used throughout manufacturing operations.

36 Current MTConnect implementations are based on HTTP as a transport protocol and XML as a  
37 language for encoding each of the *semantic data models* into electronic documents. All software  
38 examples provided in the various MTConnect Standard documents are based on these two core  
39 technologies.

40 The base functionality defined in the MTConnect Standard is the *data dictionary* describing  
41 manufacturing information and the *semantic data models*. The transport protocol and the  
42 programming language used to represent or transfer the information provided by the *semantic*  
43 *data models* are not restricted in the standard to HTTP and XML. Therefore, other protocols and  
44 programming languages may be used to represent the semantic models and/or transport the  
45 information provided by these data models between an *MTConnect Agent* (server) and a client  
46 software application as may be required by a specific implementation.

47 Note: The term “document” is used with different meanings in the MTConnect Standard:

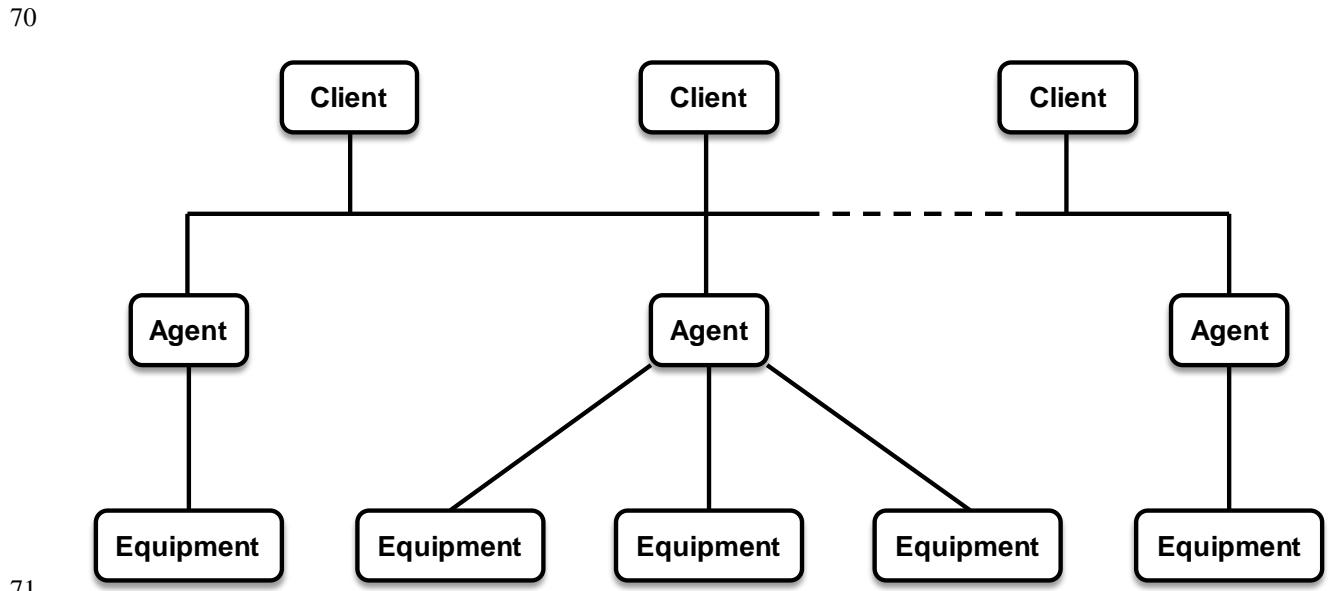

- 48 • Meaning 1: The MTConnect Standard itself is comprised of multiple documents  
49 each addressing different aspects of the Standard. Each document is referred to as a  
50 *Part* of the Standard.
- 51 • Meaning 2: In an MTConnect implementation, the electronic documents that are  
52 published from a data source and stored by an *MTConnect Agent*.
- 53 • Meaning 3: In an MTConnect implementation, the electronic documents generated  
54 by an *MTConnect Agent* for transmission to a client software application.

55 The following will be used throughout the MTConnect Standard to distinguish between  
56 these different meanings for the term “document”:

- 57 • MTConnect Document(s) or Document(s) shall be used to refer to printed or  
58 electronic document(s) that represent a *Part(s)* of the MTConnect Standard.
- 59 • All reference to electronic documents that are received from a data source and  
60 stored in an *MTConnect Agent* shall be referred to as “*Document(s)*” and are  
61 typically provided with a prefix identifier; e.g. *Asset Document*.
- 62 • All references to electronic documents generated by an *MTConnect Agent* and sent  
63 to a client software application shall be referred to as a “*Response Document*”.

64 When used with no additional descriptor, the form “document” shall be used to refer to  
65 any printed or electronic document.

68 Manufacturing software systems implemented utilizing MTConnect can be represented by a very  
 69 simple structure:

72 **Figure 1: Basic MTConnect Implementation Structure**

73

74 The three basic modules that comprise a software system implemented using MTConnect are:

75 **Equipment:** Any data source. In the MTConnect Standard, equipment is defined as any  
 76 tangible property that is used to equip the operations of a manufacturing facility. Examples of  
 77 equipment are machine tools, ovens, sensor units, workstations, software applications, and bar  
 78 feeders.

79 **MTConnect Agent:** Software that collects data published from one or more piece(s) of  
 80 equipment, organizes that data in a structured manner, and responds to requests for data from  
 81 client software systems by providing a structured response in the form of a *Response  
 82 Document* that is constructed using the *semantic data models* defined in the Standard.

83 Note: The *MTConnect Agent* may be fully integrated into the piece of equipment or the  
 84 *Agent* may be independent of the piece of equipment. Implementation of an *Agent* is  
 85 the responsibility of the supplier of the piece of equipment and/or the implementer of  
 86 the *MTConnect Agent*.

87 **Client Software Application:** Software that requests data from *MTConnect Agents* and  
 88 processes that data in support of manufacturing operations.

89

90 Based on *Figure 1* above, it is important to understand that the MTConnect Standard only  
 91 addresses the following functionality and behavior of an *MTConnect Agent*:

- 92     • the method used by a client software application to request information from an  
     93       *MTConnect Agent*.
- 94     • the response that a *MTConnect Agent* provides to a client software application.
- 95     • a *data dictionary* used to provide consistency in understanding the meaning of data  
     96       reported by a data source.
- 97     • the description of the *semantic data models* used to structure *Response Documents*  
     98       provided by a *MTConnect Agent* to a client software application.

99 These functions are the primary building blocks that define the *Base Functional Structure* of the  
 100 MTConnect Standard.

101 There are a wide variety of data sources (equipment) and data consumption systems (client  
 102 software systems) used in manufacturing operations. There are also many different uses for the  
 103 data associated with a manufacturing operation. No single approach to implementing a data  
 104 communication system can address all data exchange and data management functions typically  
 105 required in the data driven manufacturing environment. MTConnect has been uniquely designed  
 106 to address this diversity of data types and data usages by providing different *semantic data*  
 107 *models* for different data application requirements:

108 **Data Collection:** The most common use of data in manufacturing is the collection of data  
 109 associated with the production of products and the operation of equipment that produces those  
 110 products. The MTConnect Standard provides comprehensive *semantic data models* that  
 111 represent data collected from manufacturing operations. These *semantic data models* are  
 112 detailed in *Part 2.0 – Devices Information Model* and *Part 3.0 – Streams Information Model* of  
 113 the MTConnect Standard.

114 **Inter-operations Between Pieces of Equipment:** The MTConnect Standard provides an  
 115 *Interaction Model* that structures the information required to allow multiple pieces of equipment  
 116 to coordinate actions required to implement manufacturing activities. This *Interaction Model* is  
 117 an implementation of a *Request/Response Messaging Structure*. This *Interaction Model* is called  
 118 *Interfaces* which is detailed in *Part 5.0 - Interfaces* of the MTConnect Standard.

119 **Shared Data:** Certain information used in a manufacturing operation is commonly shared  
 120 amongst multiple pieces of equipment and/or software applications. This information is not  
 121 typically “owned” by any one manufacturing resource. The MTConnect Standard represents this  
 122 information through a series of *semantic data models* – each describing different types of  
 123 information used in the manufacturing environment. Each type of information is called an  
 124 *MTConnect Asset*. *MTConnect Assets* are detailed in *Part 4.0 – Assets Information Model*, and  
 125 its sub-*Parts*, of the MTConnect Standard.

## 126 **2 Purpose of This Document**

127 This document, *Part 1.0 – Overview and Functionality* of the MTConnect® Standard, addresses  
128 two major topics relating to the MTConnect Standard. The first sections of the document define  
129 the organization of the documents used to describe the MTConnect Standard; including the terms  
130 and terminology used throughout the Standard. The balance of the document defines the  
131 following:

- 132 • Operational concepts describing how an *MTConnect Agent* should organize and structure  
133 data that has been collected from a data source.
- 134 • Definition and structure of the *Response Documents* supplied by an *MTConnect Agent*.
- 135 • The protocol used by a client software application to communicate with an *MTConnect*  
136 *Agent*.

137

138 **3 Terminology**

139 The definitions for terms and terminology as used to describe the features and functions within  
 140 the MTConnect Standard are provided below.

Term	Definition as Used in the MTConnect Standard
<b>Abstract Element</b>	<p>An element that defines a set of common characteristics that are shared by a group of elements.</p> <p>An abstract element cannot appear in a document. In a specific implementation of a schema, an abstract element is replaced by a derived element that is itself not an abstract element. The characteristics for the derived element are inherited from the abstract element.</p> <p>Appears in the documents in the following form: abstract.</p>
<b>Adapter</b>	<p>An optional piece of hardware or software that transforms information provided by a piece of equipment into a form that can be received by an <i>MTConnect Agent</i>.</p> <p>Appears in the documents in the following form: adapter.</p>
<b>Agent</b>	<p>Refers to an <i>MTConnect Agent</i>.</p> <p>Software that collects data published from one or more piece(s) of equipment, organizes that data in a structured manner, and responds to requests for data from client software systems by providing a structured response in the form of a <i>Response Document</i> that is constructed using the <i>semantic data models</i> defined in the Standard.</p> <p>Appears in the documents in the following form: <i>MTConnect Agent</i> or <i>Agent</i>.</p>
<b>Application Programming Interface (API)</b>	<p>A set of methods to provide communications between software applications.</p> <p>The API defined in the MTConnect Standard describes the methods for providing the <i>Request/Response Information Exchange</i> between an <i>MTConnect Agent</i> and client software applications.</p> <p>Appears in the documents in the following forms: Application Programming Interface or API.</p>

Term	Definition as Used in the MTConnect Standard
Archetype	<p><b><u>General Description of an <i>MTConnect Asset</i>:</u></b></p> <p>Archetype is a class of <i>MTConnect Assets</i> that provides the requirements, constraints, and common properties for a type of <i>MTConnect Asset</i>.</p> <p>Appears in the documents in the following form: Archetype.</p> <p><b><u>Used as an XML term describing an <i>MTConnect Asset</i>:</u></b></p> <p>In an XML representation of the <i>Assets Information Model</i>, Archetype is an abstract element that is replaced by a specific type of <i>Asset Archetype</i>.</p> <p>Appears in the documents in the following form: Archetype.</p>
Asset	<p><b><u>General meaning:</u></b></p> <p>Typically referred to as an <i>MTConnect Asset</i>.</p> <p>An <i>MTConnect Asset</i> is something that is used in the manufacturing process, but is not permanently associated with a single piece of equipment, can be removed from the piece of equipment without compromising its function, and can be associated with other pieces of equipment during its lifecycle.</p> <p><b><u>Used to identify a storage area in an <i>MTConnect Agent</i>:</u></b></p> <p>See description of Buffer.</p> <p><b><u>Used as an <i>Information Model</i>:</u></b></p> <p>Used to describe an <i>Information Model</i> that contains the rules and terminology that describe information that may be included in electronic documents representing <i>MTConnect Assets</i>.</p> <p>The <i>Assets Information Model</i> defines the structure for the <i>Assets Response Document</i>.</p> <p>Individual <i>Information Models</i> describe the structure of the <i>Asset Documents</i> represent each type of <i>MTConnect Asset</i>. Appears in the documents in the following form: <i>Assets Information Model</i> or <i>(asset type) Information Model</i>.</p>

Term	Definition as Used in the MTConnect Standard
<b>Asset (cont.)</b>	<p><b><u>Used when referring to an <i>MTConnect Asset</i>:</u></b></p> <p>Refers to the information related to an <i>MTConnect Asset</i> or a group of <i>MTConnect Assets</i>.</p> <p>Appears in the documents in the following form: <i>Asset</i> or <i>Assets</i>.</p> <p><b><u>Used as an XML container or element:</u></b></p> <ul style="list-style-type: none"> <li>• When used as an XML container that consists of one or more types of <i>Asset</i> XML elements.</li> </ul> <p>Appears in the documents in the following form: <i>Assets</i>.</p> <ul style="list-style-type: none"> <li>• When used as an abstract XML element. It is replaced in the XML document by types of <i>Asset</i> elements representing individual <i>Asset</i> entities.</li> </ul> <p>Appears in the documents in the following form: <i>Asset</i>.</p> <p><b><u>Used to describe information stored in an <i>MTConnect Agent</i>:</u></b></p> <p>Identifies an electronic document published by a data source and stored in the <i>assets buffer</i> of an <i>MTConnect Agent</i>.</p> <p>Appears in the documents in the following form: <i>Asset Document</i>.</p> <p><b><u>Used as an XML representation of an <i>MTConnect Response document</i>:</u></b></p> <p>Identifies an electronic document encoded in XML and published by an <i>MTConnect Agent</i> in response to a <i>Request</i> for information from a client software application relating to <i>MTConnect Assets</i>.</p> <p>Appears in the documents in the following form: <i>MTConnectAssets</i>.</p> <p><b><u>Used as an <i>MTConnect Request</i>:</u></b></p> <p>Represents a specific type of communications request between a client software application and an <i>MTConnect Agent</i> regarding <i>MTConnect Assets</i>.</p> <p>Appears in the documents in the following form: <i>Asset Request</i>.</p> <p><b><u>Used as part of an <i>HTTP Request</i>:</u></b></p> <p>Used in the path portion of an <i>HTTP Request Line</i>, by a client software application, to initiate an <i>Asset Request</i> to an <i>MTConnect Agent</i> to publish an <i>MTConnectAssets</i> document.</p> <p>Appears in the documents in the following form: <i>asset</i>.</p>

Term	Definition as Used in the MTConnect Standard
<b>Attribute</b>	<p>A term that is used to provide additional information or properties for an element.</p> <p>Appears in the documents in the following form: <i>attribute</i>.</p>
<b>Base Functional Structure</b>	<p>A consistent set of functionalities defined by the MTConnect Standard. This functionality includes the protocol(s) used to communicate data to a client software application, the <i>semantic data models</i> defining how that data is organized into <i>Response Documents</i>, and the encoding of those <i>Response Documents</i>.</p> <p>Appears in the documents in the following form: <i>Base Functional Structure</i>.</p>
<b>Buffer</b>	<p><b><u>General meaning:</u></b></p> <p>A section of an <i>MTConnect Agent</i> that provides storage for information published from pieces of equipment.</p> <p><b><u>Used relative to Streaming Data:</u></b></p> <p>A section of an <i>MTConnect Agent</i> that provides storage for information relating to individual pieces of <i>Streaming Data</i>.</p> <p>Appears in the documents in the following form: <i>buffer</i>.</p> <p><b><u>Used relative to MTConnect Assets:</u></b></p> <p>A section of an <i>MTConnect Agent</i> that provides storage for <i>Asset Documents</i>.</p> <p>Appears in the documents in the following form: <i>assets buffer</i>.</p>
<b>CDATA</b>	<p><b><u>General meaning:</u></b></p> <p>An abbreviation for <b>Character Data</b>.</p> <p>CDATA is used to describe a value (text or data) published as part of an XML element.</p> <p>For example, “<i>This is some text</i>” is the CDATA in the XML element:</p> <ol style="list-style-type: none"> <li>1. &lt;Message ...&gt;This is some text&lt;/Message&gt;</li> </ol> <p>Appears in the documents in the following form: CDATA.</p>
<b>Child Element</b>	<p>A portion of a data modeling structure that illustrates the relationship between an element and the higher-level <i>Parent Element</i> within which it is contained.</p> <p>Appears in the documents in the following form: <i>Child Element</i>.</p>

Term	Definition as Used in the MTConnect Standard
<b>Client</b>	<p>A process or set of processes that send <i>Requests</i> for information to an <i>MTConnect Agent</i>; e.g. software applications or a function that implements the <i>Request</i> portion of an <i>Interface Interaction Model</i>.</p> <p>Appears in the documents in the following form: client.</p>
<b>Component</b>	<p><b><u>General meaning:</u></b></p> <p>A <i>Structural Element</i> that represents a physical or logical part or sub-part of a piece of equipment.</p> <p>Appears in the documents in the following form: Component.</p> <p><b><u>Used in Information Models:</u></b></p> <p>A data modeling element used to organize the data being retrieved from a piece of equipment.</p> <ul style="list-style-type: none"> <li>• When used as an XML container to organize <i>Lower Level Component</i> elements.</li> </ul> <p>Appears in the documents in the following form: Components.</p> <ul style="list-style-type: none"> <li>• When used as an abstract XML element. Component is replaced in a data model by a type of Component element. Component is also an XML container used to organize <i>Lower Level Component</i> elements, <i>Data Entities</i>, or both.</li> </ul> <p>Appears in the documents in the following form: Component.</p>

Term	Definition as Used in the MTConnect Standard
<b>Composition</b>	<p><b><u>General meaning:</u></b></p> <p>Data modeling elements that describe the lowest level basic structural or functional building blocks contained within a Component element.</p> <p>Appears in the documents in the following form: <i>Composition Element</i>.</p> <p><b><u>Used in Information Models:</u></b></p> <ul style="list-style-type: none"> <li>• When used as an XML container to organize Composition elements. Appears in the documents in the following form: Compositions.</li> <li>• When used as an abstract XML element. Composition is replaced in a data model by a type of <i>Composition Element</i>. Appears in the documents in the following form: Composition.</li> </ul>

Term	Definition as Used in the MTConnect Standard
<b>Condition</b>	<p><b><u>General meaning:</u></b></p> <p>An indicator of the health of a piece of equipment or a <i>Component</i> and its ability to function.</p> <p><b><u>Used as a modeling element:</u></b></p> <p>A data modeling element used to organize and communicate information relative to the health of a piece of equipment or <i>Component</i>.</p> <p>Appears in the documents in the following form: <i>Condition</i> or as <i>Condition Element(s)</i>.</p> <p><b><u>Used in Information Models:</u></b></p> <p>An XML element used to represent <i>Condition Elements</i>.</p> <ul style="list-style-type: none"> <li>• When used as an XML container to organize <i>Lower Level Condition</i> elements.           <p>Appears in the documents in the following form: <i>Condition</i>.</p> </li> <li>• When used as a <i>Lower Level</i> element, the form <i>Condition</i> is an abstract type XML element. This <i>Lower Level</i> element is a <i>Data Entity</i>. <i>Condition</i> is replaced in a data model by type of <i>Condition</i> element.           <p>Appears in the documents in the following form: <i>Condition</i>.</p> </li> </ul> <p>Note: The form <i>Condition</i> is used to represent both above uses.</p>
<b>Controlled Vocabulary</b>	<p>A restricted set of values that may be published as the <i>Valid Data Value</i> for a <i>Data Entity</i>.</p> <p>Appears in the documents in the following form: <i>Controlled Vocabulary</i>.</p>

Term	Definition as Used in the MTConnect Standard
<b>Current</b>	<p><b><u>General meaning:</u></b></p> <p>Meaning 1: A term describing the most recent occurrence of something.</p> <p>Meaning 2: A term used to describe movement; e.g. electric current or air current.</p> <p>Appears in the documents in the following form: current</p> <p><b><u>Used in reference to an <i>MTConnect Agent</i>:</u></b></p> <p>A reference to the most recent information available to an <i>MTConnect Agent</i>.</p> <p>Appears in the documents in the following form: current.</p> <p><b><u>Used as an <i>MTConnect Request</i>:</u></b></p> <p>A specific type of communications request between a client software application and an <i>MTConnect Agent</i> regarding <i>Streaming Data</i>.</p> <p>Appears in the documents in the following form: <i>Current Request</i>.</p> <p><b><u>Used as part of an <i>HTTP Request</i>:</u></b></p> <p>Used in the path portion of an <i>HTTP Request Line</i>, by a client software application, to initiate a <i>Current Request</i> to an <i>MTConnect Agent</i> to publish an <i>MTConnectStreams</i> document.</p> <p>Appears in the documents in the following form: current.</p>
<b>Data Dictionary</b>	<p>Listing of standardized terms and definitions used in <i>MTConnect Information Models</i>.</p> <p>Appears in the documents in the following form: <i>data dictionary</i>.</p>
<b>Data Entity</b>	<p>A primary data modeling element that represents all elements that either describe data items that may be reported by an <i>MTConnect Agent</i> or the data items that contain the actual data published by an <i>Agent</i>.</p> <p>Appears in the documents in the following form: <i>Data Entity</i>.</p>

Term	Definition as Used in the MTConnect Standard
<b>Data Item</b>	<p><b><u>General meaning:</u></b>            Descriptive information or properties and characteristics associated with a <i>Data Entity</i>.            Appears in the documents in the following form: data item.</p> <p><b><u>Used in an XML representation of a <i>Data Entity</i>:</u></b></p> <ul style="list-style-type: none"> <li>When used as an XML container to organize DataItem elements.            Appears in the documents in the following form:            DataItems.</li> <li>When used to represent a specific <i>Data Entity</i>, the form DataItem is an XML element.            Appears in the documents in the following form: DataItem.</li> </ul>
<b>Data Source</b>	<p>Any piece of equipment that can produce data that is published to an <i>MTConnect Agent</i>.            Appears in the documents in the following form: data source.</p>
<b>Data Streaming</b>	<p>A method for an <i>MTConnect Agent</i> to provide a continuous stream of information in response to a single <i>Request</i> from a client software application.            Appears in the documents in the following form: <i>Data Streaming</i>.</p>
<b>Deprecated</b>	<p>An indication that specific content in an <i>MTConnect Document</i> is currently usable but is regarded as being obsolete or superseded. It is recommended that deprecated content should be avoided.            Appears in the documents in the following form: <b>DEPRECATED</b>.</p>
<b>Deprecation Warning</b>	<p>An indicator that specific content in an <i>MTConnect Document</i> may be changed to <b>DEPRECATED</b> in a future release of the standard.            Appears in the documents in the following form: <b>DEPRECATION WARNING</b>.</p>
<b>Devices Information Model</b>	<p>A set of rules and terms that describes the physical and logical configuration for a piece of equipment and the data that may be reported by that equipment.            Appears in the documents in the following form: <i>Devices Information Model</i>.</p>

Term	Definition as Used in the MTConnect Standard
<b>Device</b>	<p>A part of an information model representing a piece of equipment.</p> <p><b><u>Used in an XML representation of a <i>Response Document</i>:</u></b></p> <ul style="list-style-type: none"> <li>When used as an XML container to organize <i>Device</i> elements.</li> </ul> <p>Appears in the documents in the following form: <i>Devices</i>.</p> <ul style="list-style-type: none"> <li>When used as an XML container to represent a specific piece of equipment and is composed of a set of <i>Structural Elements</i> that organize and provide relevance to data published from that piece of equipment.</li> </ul> <p>Appears in the documents in the following form: <i>Device</i>.</p>
<b>Document</b>	<p><b><u>General meaning:</u></b></p> <p>A piece of written, printed, or electronic matter that provides information.</p> <p><b><u>Used to represent an MTConnect Document:</u></b></p> <p>Refers to printed or electronic document(s) that represent a <i>Part(s)</i> of the MTConnect Standard.</p> <p>Appears in the documents in the following form: <i>MTConnect Document</i>.</p> <p><b><u>Used to represent a specific representation of an MTConnect Document:</u></b></p> <p>Refers to electronic document(s) associated with an <i>MTConnect Agent</i> that are encoded using XML; <i>Response Documents</i> or <i>Asset Documents</i>.</p> <p>Appears in the documents in the following form: <i>MTConnect XML Document</i>.</p> <p><b><u>Used to describe types of information stored in an MTConnect Agent:</u></b></p> <p>In an implementation, the electronic documents that are published from a data source and stored by an <i>MTConnect Agent</i>.</p> <p>Appears in the documents in the following form: <i>Asset Document</i>.</p> <p><b><u>Used to describe information published by an MTConnect Agent:</u></b></p> <p>A document published by an <i>MTConnect Agent</i> based upon one of the <i>semantic data models</i> defined in the MTConnect Standard in response to a request from a client.</p> <p>Appears in the documents in the following form: <i>Response Document</i>.</p>

Term	Definition as Used in the MTConnect Standard
<b>Document Body</b>	<p>The portion of the content of an <i>MTConnect Response Document</i> that is defined by the relative <i>MTConnect Information Model</i>. The <i>Document Body</i> contains the <i>Structural Elements</i> and <i>Data Entities</i> reported in a <i>Response Document</i>.</p> <p>Appears in the documents in the following form: <i>Document Body</i>.</p>
<b>Document Header</b>	<p>The portion of the content of an <i>MTConnect Response Document</i> that provides information from an <i>MTConnect Agent</i> defining version information, storage capacity, protocol, and other information associated with the management of the data stored in or retrieved from the <i>Agent</i>.</p> <p>Appears in the documents in the following form: <i>Document Header</i>.</p>
<b>Element</b>	<p>Refers to an XML element.</p> <p>An XML element is a logical portion of an XML document or schema that begins with a <code>start-tag</code> and ends with a corresponding <code>end-tag</code>.</p> <p>The information provided between the <code>start-tag</code> and <code>end-tag</code> may contain attributes, other elements (sub-elements), and/or CDATA.</p> <p>Note: Also, an XML element may consist of an <code>empty-element tag</code>. Refer to <i>Appendix B</i> for more information on element tags.</p> <p>Appears in the documents in the following form: <i>element</i>.</p>
<b>Element Name</b>	<p>A descriptive identifier contained in both the <code>start-tag</code> and <code>end-tag</code> of an XML element that provides the name of the element.</p> <p>Appears in the documents in the following form: <i>element name</i>.</p> <p><b><u>Used to describe the name for a specific XML element:</u></b></p> <p>Reference to the name provided in the <code>start-tag</code>, <code>end-tag</code>, or <code>empty-element tag</code> for an XML element.</p> <p>Appears in the documents in the following form: <i>Element Name</i>.</p>
<b>Equipment</b>	<p>Represents anything that can publish information and is used in the operations of a manufacturing facility shop floor. Examples of equipment are machine tools, ovens, sensor units, workstations, software applications, and bar feeders.</p> <p>Appears in the documents in the following form: <i>equipment</i> or <i>piece of equipment</i>.</p>

Term	Definition as Used in the MTConnect Standard
<b>Error Information Model</b>	<p>The rules and terminology that describes the <i>Response Document</i> returned by an <i>MTConnect Agent</i> when it encounters an error while interpreting a <i>Request</i> for information from a client software application or when an <i>Agent</i> experiences an error while publishing the <i>Response</i> to a <i>Request</i> for information.</p> <p>Appears in the documents in the following form: <i>Error Information Model</i>.</p>
<b>Event</b>	<p><b><u>General meaning:</u></b>  The occurrence of something that happens or takes place.</p> <p>Appears in the documents in the following form: event.</p> <p><b><u>Used as a type of Data Entity:</u></b>  An identification that represents a change in state of information associated with a piece of equipment or an occurrence of an action. Event also provides a means to publish a message from a piece of equipment.</p> <p>Appears in the documents in the following form: Event.</p> <p><b><u>Used as a category attribute for a Data Entity:</u></b>  Used as a value for the category attribute for an XML dataItem element.</p> <p>Appears in the documents in the following form: EVENT.</p> <p><b><u>Used as an XML container or element:</u></b></p> <ul style="list-style-type: none"> <li>• When used as an XML container that consists of one or more types of Event XML elements.  Appears in the documents in the following form: Events .</li> <li>• When used as an abstract XML element. It is replaced in the XML document by types of Event elements.  Appears in the documents in the following form: Event.</li> </ul>
<b>Extensible</b>	<p>The ability for an implementer to extend <i>MTConnect Information Models</i> by adding content not currently addressed in the MTConnect Standard.</p>
<b>Fault State</b>	<p>In the MTConnect Standard, a term that indicates the reported status of a <i>Condition</i> category Data Entity.</p> <p>Appears in the documents in the following form: Fault State.</p>

Term	Definition as Used in the MTConnect Standard
<b>Heartbeat</b>	<p><b><u>General meaning:</u></b></p> <p>A function that indicates to a client application that the communications connection to an <i>MTConnect Agent</i> is still viable during times when there is no new data available to report – often referred to as a “keep alive” message.</p> <p>Appears in the documents in the following form: <i>heartbeat</i>.</p> <p><b><u>When used as part of an <i>HTTP Request</i>:</u></b></p> <p>The form <i>heartbeat</i> is used as a parameter in the <i>query</i> portion of an <i>HTTP Request Line</i>.</p> <p>Appears in the documents in the following form: <i>heartbeat</i>.</p>
<b>HTTP</b>	<p><b>Hyper-Text Transport Protocol.</b> The protocol used by all web browsers and web applications.</p> <p>Note: HTTP is an IETF standard and is defined in RFC 7230. See <a href="https://tools.ietf.org/html/rfc7230">https://tools.ietf.org/html/rfc7230</a> for more information.</p>
<b>HTTP Error Message</b>	<p>In the MTConnect Standard, a response provided by an <i>MTConnect Agent</i> indicating that an <i>HTTP Request</i> is incorrectly formatted or identifies that the requested data is not available from the <i>Agent</i>.</p> <p>Appears in the documents in the following form: <i>HTTP Error Message</i>.</p>
<b>HTTP Header</b>	<p>In the MTConnect Standard, the content of the <i>Header</i> portion of either an <i>HTTP Request</i> from a client software application or an <i>HTTP Response</i> from an <i>MTConnect Agent</i>.</p> <p>Appears in the documents in the following form: <i>HTTP Header</i>.</p>
<b>HTTP Method</b>	<p>In the MTConnect Standard, a portion of a command in an <i>HTTP Request</i> that indicates the desired action to be performed on the identified resource; often referred to as verbs.</p>
<b>HTTP Request</b>	<p>In the MTConnect Standard, a communications command issued by a client software application to an <i>MTConnect Agent</i> requesting information defined in the <i>HTTP Request Line</i>.</p> <p>Appears in the documents in the following form: <i>HTTP Request</i>.</p>

Term	Definition as Used in the MTConnect Standard
<b>HTTP Request Line</b>	<p>In the MTConnect Standard, the first line of an <i>HTTP Request</i> describing a specific <i>Response Document</i> to be published by an <i>MTConnect Agent</i>.</p> <p>Appears in the documents in the following form: <i>HTTP Request Line</i>.</p>
<b>HTTP Response</b>	<p>In the MTConnect Standard, the information published from an <i>MTConnect Agent</i> in reply to an <i>HTTP Request</i>. An <i>HTTP Response</i> may be either a <i>Response Document</i> or an <i>HTTP Error Message</i>.</p> <p>Appears in the documents in the following form: <i>HTTP Response</i>.</p>
<b>HTTP Server</b>	<p>In the MTConnect Standard, a software program that accepts <i>HTTP Requests</i> from client software applications and publishes <i>HTTP Responses</i> as a reply to those <i>Requests</i>.</p> <p>Appears in the documents in the following form: <i>HTTP Server</i>.</p>
<b>HTTP Status Code</b>	<p>In the MTConnect Standard, a numeric code contained in an <i>HTTP Response</i> that defines a status category associated with the <i>Response</i> – either a success status or a category of an HTTP error.</p> <p>Appears in the documents in the following form: <i>HTTP Status Code</i>.</p>
<b>id</b>	<p><b><u>General meaning:</u></b>  An identifier used to distinguish a piece of information.  Appears in the documents in the following form: <i>id</i>.</p> <p><b><u>Used as an XML attribute:</u></b>  When used as an attribute for an XML element - <i>Structural Element</i>, <i>Data Entity</i>, or <i>Asset</i>. <i>id</i> provides a unique identity for the element within an XML document.  Appears in the documents in the following form: <i>id</i>.</p>
<b>Implementation</b>	A specific instantiation of the MTConnect Standard.
<b>Information Model</b>	<p>The rules, relationships, and terminology that are used to define how information is structured.</p> <p>For example, an information model is used to define the structure for each <i>MTConnect Response Document</i>; the definition of each piece of information within those documents and the relationship between pieces of information.</p> <p>Appears in the documents in the following form: <i>Information Model</i>.</p>

Term	Definition as Used in the MTConnect Standard
<b>Instance</b>	<p>Describes a set of <i>Streaming Data</i> in an <i>MTConnect Agent</i>. Each time an <i>Agent</i> is restarted with an empty <i>buffer</i>, data placed in the <i>buffer</i> represents a new <i>instance</i> of the <i>Agent</i>.</p> <p>Appears in the documents in the following form: <i>instance</i>.</p>
<b>Interaction Model</b>	<p>The definition of information exchanged to support the interactions between pieces of equipment collaborating to complete a task.</p> <p>Appears in the documents in the following form: <i>Interaction Model</i>.</p>
<b>Interface</b>	<p><b><u>General meaning:</u></b>  The exchange of information between pieces of equipment and/or software systems.</p> <p>Appears in the documents in the following form: <i>interface</i>.</p> <p><b><u>Used as an Interaction Model:</u></b>  An <i>Interaction Model</i> that describes a method for inter-operations between pieces of equipment.</p> <p>Appears in the documents in the following form: <i>Interface</i>.</p> <p><b><u>Used as an XML container or element:</u></b></p> <ul style="list-style-type: none"> <li>• When used as an XML container that consists of one or more types of <i>Interface</i> XML elements.  Appears in the documents in the following form:  <i>Interfaces</i>.</li> <li>• When used as an abstract XML element. It is replaced in the XML document by types of <i>Interface</i> elements.  Appears in the documents in the following form:  <i>Interface</i>.</li> </ul>

Term	Definition as Used in the MTConnect Standard
<b>Message</b>	<p><b><u>General meaning:</u></b>  The content of a communication process.  Appears in the documents in the following form: message.</p> <p><b><u>Used relative to an <i>MTConnect Agent</i>:</u></b>  Describes the information that is exchanged between an <i>MTConnect Agent</i> and a client software application. A <i>Message</i> may contain either a <i>Request</i> from a client software application or a <i>Response</i> from an <i>MTConnect Agent</i>.  Appears in the documents in the following form: <i>Message</i>.</p> <p><b><u>Used as a type of <i>Data Entity</i>:</u></b>  Describes a type of <i>Data Entity</i> in the <i>Devices Information Model</i> that can contain any text string of information or native code to be transferred from a piece of equipment.  Appears in the documents in the following form: MESSAGE.</p> <p><b><u>Used as an <i>Element Name</i>:</u></b>  An <i>Element Name</i> for a <i>Data Entity</i> in the <i>Streams Information Model</i> that can contain any text string of information or native code to be transferred from a piece of equipment.  Appears in the documents in the following form: Message.</p>
<b>Metadata</b>	Data that provides information about other data. For example, <i>Equipment Metadata</i> defines both the <i>Structural Elements</i> that represent the physical and logical parts and sub-parts of each piece of equipment, the relationships between those parts and sub-parts, and the definitions of the <i>Data Entities</i> associated with that piece of equipment. Appears in the documents in the following form: <i>Metadata</i> or <i>Equipment Metadata</i> .
<b>MTConnect Agent</b>	See definition for <i>Agent</i> .
<b>MTConnectAssets Response Document</b>	An electronic document published by an <i>MTConnect Agent</i> in response to a <i>Request</i> for information from a client software application relating to <i>MTConnect Assets</i> . Appears in the documents in the following form: <i>MTConnectAssets Response Document</i> .

Term	Definition as Used in the MTConnect Standard
<b>MTConnectDevices Response Document</b>	<p>An electronic document published by an <i>MTConnect Agent</i> in response to a <i>Request</i> for information from a client software application that includes <i>metadata</i> for one or more pieces of equipment.</p> <p>Appears in the documents in the following form: <i>MTConnectDevices Response Document</i>.</p>
<b>MTConnectErrors Response Document</b>	<p>An electronic document published by an <i>MTConnect Agent</i> whenever it encounters an error while interpreting a <i>Request</i> for information from a client software application or when an <i>Agent</i> experiences an error while publishing the <i>Response</i> to a <i>Request</i> for information.</p> <p>Appears in the documents in the following form: <i>MTConnectErrors Response Document</i>.</p>
<b>MTConnect Request</b>	<p>A communication request for information issued from a client software application to an <i>MTConnect Agent</i>.</p> <p>Appears in the documents in the following form: <i>MTConnect Request</i>.</p>
<b>MTConnectStreams Response Document</b>	<p>An electronic document published by an <i>MTConnect Agent</i> in response to a <i>Request</i> for information from a client software application that includes <i>Streaming Data</i> from the <i>Agent</i>.</p> <p>Appears in the documents in the following form: <i>MTConnectStreams Response Document</i>.</p>
<b>NMTOKEN</b>	<p>The data type for XML identifiers.</p> <p>Note: The identifier must start with a letter, an underscore “_” or a colon. The next character must be a letter, a number, or one of the following “.”, “-”, “_”, “:”. The identifier must not have any spaces or special characters.</p> <p>Appears in the documents in the following form: NMTOKEN.</p>
<b>Parameter</b>	<p><b>General Meaning:</b></p> <p>A variable that must be given a value during the execution of a program or a communications command.</p> <p><b>When used as part of an <i>HTTP Request</i>:</b></p> <p>Represents the content (keys and associated values) provided in the <i>Query</i> portion of an <i>HTTP Request Line</i> that identifies specific information to be returned in a <i>Response Document</i>.</p> <p>Appears in the documents in the following form: parameter.</p>

Term	Definition as Used in the MTConnect Standard
<b>Parent Element</b>	<p>An XML element used to organize <i>Lower Level</i> child elements that share a common relationship to the <i>Parent Element</i>.</p> <p>Appears in the documents in the following form: <i>Parent Element</i>.</p>
<b>Persistence</b>	<p>A method for retaining or restoring information.</p>
<b>Probe</b>	<p><b><u>General meaning of a physical entity:</u></b></p> <p>An instrument commonly used for measuring the physical geometrical characteristics of an object.</p> <ul style="list-style-type: none"> <li>• <b><u>Used to describe a measurement device:</u></b></li> </ul> <p>The form probe is used to define a measurement device that provides position information.</p> <p>Appears in the documents in the following form: probe.</p> <ul style="list-style-type: none"> <li>• <b><u>Used within a Data Entity:</u></b></li> </ul> <p>The form PROBE is used to designate a subtype for the <i>Data Entity PATH_POSITION</i> indicating a measurement position relating to a probe unit.</p> <p>Appears in the documents in the following form: PROBE.</p> <p><b><u>General meaning for communications with an MTConnect Agent:</u></b></p> <p>Probe is used to define a type of communication request.</p> <ul style="list-style-type: none"> <li>• <b><u>Used as a type of communication request:</u></b></li> </ul> <p>The form <i>Probe Request</i> represents a specific type of communications request between a client software application and an <i>MTConnect Agent</i> regarding <i>metadata</i> for one or more pieces of equipment.</p> <p>Appears in the documents in the following form: <i>Probe Request</i>.</p> <ul style="list-style-type: none"> <li>• <b><u>Used in an HTTP Request Line:</u></b></li> </ul> <p>The form <i>probe</i> is used to designate a <i>Probe Request</i> in the &lt;Path&gt; portion of an <i>HTTP Request Line</i>.</p> <p>Appears in the documents in the following form: <i>probe</i>.</p>
<b>Protocol</b>	<p>A set of rules that allow two or more entities to transmit information from one to the other.</p>

Term	Definition as Used in the MTConnect Standard
<b>Publish/Subscribe</b>	<p>In the MTConnect Standard, a communications messaging pattern that may be used to publish <i>Streaming Data</i> from an <i>MTConnect Agent</i>. When a <i>Publish/Subscribe</i> communication method is established between a client software application and an <i>MTConnect Agent</i>, the <i>Agent</i> will repeatedly publish a specific <i>MTConnectStreams</i> document at a defined period.</p> <p>Appears in the documents in the following form: <i>Publish/Subscribe</i>.</p>
<b>Query</b>	<p><b><u>General Meaning:</u></b>  A portion of a request for information that more precisely defines the specific information to be published in response to the request.</p> <p>Appears in the documents in the following form: <i>Query</i>.</p> <p><b><u>Used in an HTTP Request Line:</u></b>  The form <i>query</i> includes a string of parameters that define filters used to refine the content of a <i>Response Document</i> published in response to an <i>HTTP Request</i>.</p> <p>Appears in the documents in the following form: <i>query</i>.</p>
<b>Request /Response Messaging Structure</b>	<p>A communications pattern that supports the transfer of information between an <i>MTConnect Agent</i> and a client software application. In a <i>Request/Response</i> information exchange, a client software application requests specific information from an <i>MTConnect Agent</i>. An <i>MTConnect Agent</i> responds to the <i>Request</i> by publishing a <i>Response Document</i>.</p> <p>Appears in the documents in the following form: <i>Request/Response Messaging Structure</i>.</p>
<b>Request</b>	<p>A communications method where a client software application transmits a message to an <i>MTConnect Agent</i>. That message instructs the <i>Agent</i> to respond with specific information.</p> <p>Appears in the documents in the following form: <i>Request</i>.</p>
<b>Requester</b>	<p>An entity that initiates a <i>Request</i> for information in a communications exchange.</p> <p>Appears in the documents in the following form: <i>Requester</i>.</p>
<b>Responder</b>	<p>An entity that responds to a <i>Request</i> for information in a communications exchange.</p> <p>Appears in the documents in the following form: <i>Responder</i>.</p>

Term	Definition as Used in the MTConnect Standard
<b>Response Document</b>	See definition of Document.
<b>REST</b>	<p>Stands for REpresentational State Transfer: A software architecture where a client software application and server move through a series of state transitions based solely on the request from the client and the response from the server.</p> <p>Appears in the documents in the following form: REST.</p>
<b>Root Element</b>	<p>The first <i>Structural Element</i> provided in a <i>Response Document</i> encoded using XML. The <i>Root Element</i> is an XML container and is the <i>Parent Element</i> for all other XML elements in the document. The <i>Root Element</i> appears immediately following the <i>XML Declaration</i>.</p> <p>Appears in the documents in the following form: <i>Root Element</i>.</p>

Term	Definition as Used in the MTConnect Standard
Sample	<p><b><u>General meaning:</u></b>  The collection of one or more pieces of information.</p> <p><b><u>Used when referring to the collection of information:</u></b>  When referring to the collection of a piece of information from a data source.  Appears in the documents in the following form: sample.</p> <p><b><u>Used as an <i>MTConnect Request</i>:</u></b>  When representing a specific type of communications request between a client software application and an <i>MTConnect Agent</i> regarding <i>Streaming Data</i>.  Appears in the documents in the following form: <i>Sample Request</i>.</p> <p><b><u>Used as part of an <i>HTTP Request</i>:</u></b>  Used in the path portion of an <i>HTTP Request Line</i>, by a client software application, to initiate a <i>Sample Request</i> to an <i>MTConnect Agent</i> to publish an <i>MTConnectStreams</i> document.  Appears in the documents in the following form: sample.</p> <p><b><u>Used to describe a <i>Data Entity</i>:</u></b>  Used to define a specific type of <i>Data Entity</i>. A <i>Sample</i> type <i>Data Entity</i> reports the value for a continuously variable or analog piece of information.  Appears in the documents in the following form: <i>Sample</i> or <i>Samples</i>.</p> <p><b><u>Used as an XML container or element:</u></b></p> <ul style="list-style-type: none"> <li>• When used as an XML container that consists of one or more types of <i>Sample</i> XML elements.  Appears in the documents in the following form: <i>Samples</i>.</li> <li>• When used as an abstract XML element. It is replaced in the XML document by types of <i>Sample</i> elements representing individual <i>Sample</i> type of <i>Data Entity</i>.  Appears in the documents in the following form: <i>Sample</i>.</li> </ul>

Term	Definition as Used in the MTConnect Standard
<b>Schema</b>	<p><b><u>General meaning:</u></b>  The definition of the structure, rules, and vocabularies used to define the information published in an electronic document.</p> <p>Appears in the documents in the following form: schema.</p> <p><b><u>Used in association with an <i>MTConnect Response Document</i>:</u></b>  Identifies a specific schema defined for an <i>MTConnect Response Document</i>.</p> <p>Appears in the documents in the following form: <i>schema</i>.</p>
<b>Semantic Data Model</b>	<p>A methodology for defining the structure and meaning for data in a specific logical way.</p> <p>It provides the rules for encoding electronic information such that it can be interpreted by a software system.</p> <p>Appears in the documents in the following form: <i>semantic data model</i>.</p>
<b>Sequence Number</b>	<p>The primary key identifier used to manage and locate a specific piece of <i>Streaming Data</i> in an <i>MTConnect Agent</i>.</p> <p><i>Sequence number</i> is a monotonically increasing number within an instance of an <i>MTConnect Agent</i>.</p> <p>Appears in the documents in the following form: <i>sequence number</i>.</p>
<b>Standard</b>	<p><b><u>General meaning:</u></b>  A document established by consensus that provides rules, guidelines, or characteristics for activities or their results (as defined in ISO/IEC Guide 2:2004).</p> <p><b><u>Used when referring to the MTConnect Standard.</u></b>  The MTConnect Standard is a standard that provides the definition and semantic data structure for information published by pieces of equipment.</p> <p>Appears in the documents in the following form: Standard or MTConnect Standard.</p>
<b>Streaming Data</b>	<p>The values published by a piece of equipment for the <i>Data Entities</i> defined by the <i>Equipment Metadata</i>.</p> <p>Appears in the documents in the following form: <i>Streaming Data</i>.</p>

Term	Definition as Used in the MTConnect Standard
<b>Streams Information Model</b>	<p>The rules and terminology (<i>semantic data model</i>) that describes the <i>Streaming Data</i> returned by an <i>MTConnect Agent</i> from a piece of equipment in response to a <i>Sample Request</i> or a <i>Current Request</i>.</p> <p>Appears in the documents in the following form: <i>Streams Information Model</i>.</p>
<b>Structural Element</b>	<p><b><u>General meaning:</u></b></p> <p>An XML element that organizes information that represents the physical and logical parts and sub-parts of a piece of equipment.</p> <p>Appears in the documents in the following form: <i>Structural Element</i>.</p> <p><b><u>Used to indicate hierarchy of Components:</u></b></p> <p>When used to describe a primary physical or logical construct within a piece of equipment.</p> <p>Appears in the documents in the following form: <i>Top Level Structural Element</i>.</p> <p>When used to indicate a <i>Child Element</i> which provides additional detail describing the physical or logical structure of a <i>Top Level Structural Element</i>.</p> <p>Appears in the documents in the following form: <i>Lover Level Structural Element</i>.</p>
<b>Subtype</b>	<p><b><u>General meaning:</u></b></p> <p>A secondary or subordinate type of categorization or classification of information.</p> <p>In software and data modeling, a subtype is a type of data that is related to another higher-level type of data.</p> <p>Appears in the documents in the following form: subtype.</p> <p><b><u>Used as an attribute for a Data Entity:</u></b></p> <p>Used as an attribute that provides a sub-categorization for the type attribute for a piece of information.</p> <p>Appears in the documents in the following form: subType.</p>

Term	Definition as Used in the MTConnect Standard
<b>Time Stamp</b>	<p><b><u>General meaning:</u></b>  The best available estimate of the time that the value(s) for published or recorded information was measured or determined.  Appears in the documents as “time stamp”.</p> <p><b><u>Used as an attribute for recorded or published data:</u></b>  An attribute that identifies the time associated with a <i>Data Entity</i> as stored in an <i>MTConnect Agent</i>.  Appears in the documents in the following form: timestamp.</p>
<b>Type</b>	<p><b><u>General meaning:</u></b>  A classification or categorization of information.  In software and data modeling, a type is a grouping function to identify pieces of information that share common characteristics.  Appears in the documents in the following form: type.</p> <p><b><u>Used as an attribute for a Data Entity:</u></b>  Used as an attribute that provides a categorization for piece of information that share common characteristics.  Appears in the documents in the following form: type.</p>
<b>URI</b>	<p>Stands for <b>Universal Resource Identifier</b>.  See <a href="http://www.w3.org/TR/uri-clarification/#RFC3986">http://www.w3.org/TR/uri-clarification/#RFC3986</a></p>
<b>URL</b>	<p>Stands for <b>Uniform Resource Locator</b>.  See <a href="http://www.w3.org/TR/uri-clarification/#RFC3986">http://www.w3.org/TR/uri-clarification/#RFC3986</a></p>
<b>URN</b>	<p>Stands for <b>Uniform Resource Name</b>.  See <a href="http://www.w3.org/TR/uri-clarification/#RFC3986">http://www.w3.org/TR/uri-clarification/#RFC3986</a></p>
<b>UTC/GMT</b>	<p>Stands for <b>Coordinated Universal Time/Greenwich Mean Time</b>.  UTC/GMT is the primary time standard by which the world regulates clocks and time.  The time stamp for all information reported in an <i>MTConnect Response</i> document is provided in UTC/GMT format.</p>

Term	Definition as Used in the MTConnect Standard
<b>UUID</b>	<p><b><u>General meaning:</u></b>            Stands for Universally Unique Identifier. (Can also be referred to as a GUID in some literature – Globally Unique Identifier).            Note: Defined in RFC 4122 of the IETF. See <a href="https://www.ietf.org/rfc/rfc4122.txt">https://www.ietf.org/rfc/rfc4122.txt</a> for more information.            Appears in the documents in the following form: UUID.</p> <p><b><u>Used as an attribute for an XML element:</u></b>            Used as an attribute that provides a unique identity for a piece of information reported by an <i>MTConnect Agent</i>.            Appears in the documents in the following form: <code>uuid</code>.</p>
<b>Valid Data Values</b>	<p>One or more acceptable values or constrained values that can be reported for a <i>Data Entity</i>.            Appears in the documents in the following form: <i>Valid Data Value(s)</i>.</p>
<b>W3C</b>	<p>Stands for World Wide Web Consortium.            W3C is an international community of organizations and the public work together to develop internet standards.            W3C Standards are used as a guide within the MTConnect Standard.</p>
<b>WARNING</b>	<p><b><u>General Meaning:</u></b>            A statement or action that indicates a possible danger, problem, or other unexpected situation.</p> <p><b><u>Used relative to changes in an <i>MTConnect Document</i>:</u></b>            Used to indicate that specific content in an <i>MTConnect Document</i> may be changed in a future release of the standard.            Appears in the documents in the following form: <b>WARNING</b>.</p> <p><b><u>Used as a <i>Valid Data Value</i> for a <i>Condition</i>:</u></b>            Used as a <i>Valid Data Value</i> for a <i>Condition</i> type <i>Data Entity</i>.            Appears in the documents in the following form: <b>WARNING</b>.</p> <p><b><u>Used as an <i>Element Name</i> for a <i>Data Entity</i>:</u></b>            Used as the <i>Element Name</i> for a <i>Condition</i> type <i>Data Entity</i> in an <i>MTConnectStreams Response Document</i>.            Appears in the documents in the following form: <b>Warning</b>.</p>

Term	Definition as Used in the MTConnect Standard
<b>XML</b>	<p>Stands for EXtensible Markup Language.</p> <p>XML defines a set of rules for encoding documents that both a human-readable and machine-readable.</p> <p>XML is the language used for all code examples in the MTConnect Standard.</p> <p>Refer to <a href="http://www.w3.org/XML">http://www.w3.org/XML</a> for more information about XML.</p>
<b>XML Container</b>	<p>In the MTConnect Standard, a type of XML element.</p> <p>An XML container is used to organize other XML elements that are logically related to each other. A container may have either <i>Data Entities</i> or other <i>Structural Elements</i> as <i>Child Elements</i>.</p>
<b>XML Document</b>	<p>An XML document is a structured text file encoded using XML.</p> <p>An XML document is an instantiation of an XML schema. It has a single root XML element, conforms to the XML specification, and is structured based upon a specific schema.</p> <p><i>MTConnect Response Documents</i> may be encoded as an XML document.</p>
<b>XML Schema</b>	<p>In the MTConnect Standard, an instantiation of a schema defining a specific document encoded in XML.</p>
<b>XPATH</b>	<p><b><u>General meaning:</u></b></p> <p>XPATH is a command structure that describes a way for a software system to locate information in an XML document.</p> <p>XPATH uses an addressing syntax based on a path through the document's logical structure.</p> <p>See <a href="http://www.w3.org/TR/xpath">http://www.w3.org/TR/xpath</a> for more information on XPATH.</p> <p>Appears in the documents in the following form: XPATH.</p>

## 4 MTConnect Standard

The MTConnect® Standard is organized in a series of documents (also referred to as MTConnect Documents) that each address a specific set of requirements defined by the Standard. Each MTConnect Document will be referred to as a *Part* of the Standard; e.g., *Part 1.0 - Functionality and Overview*. Together, these documents describe the *Base Functional Structure* specified in the MTConnect Standard.

Implementation of any manufacturing data management system may utilize information from any number of these documents. However, it is not necessary to realize all information contained in these documents for any one specific implementation.

### 4.1 MTConnect Documents Organization

The MTConnect specification is organized into the following documents:

*Part 1.0 – Overview and Functionality:* Provides an overview of the MTConnect Standard and defines the terminology and structure used throughout all documents associated with the Standard. Additionally, *Part 1.0* describes the functions provided by an *MTConnect Agent* and the protocol used to communicate with an *MTConnect Agent*.

*Part 2.0 – Devices Information Model:* Defines the *semantic data model* that describes the data that can be supplied by a piece of equipment. This model details the XML elements used to describe the structural and logical configuration for a piece of equipment. It also describes each type of data that may be supplied by a piece of equipment in a manufacturing operation.

*Part 3.0 – Streams Information Model:* Defines the *semantic data model* that organizes the data that is collected from a piece of equipment and transferred to a client software application from an *MTConnect Agent*.

*Part 4.0 – Assets Information Model:* Provides an overview of *MTConnect Assets* and the functions provided by an *MTConnect Agent* to communicate information relating to *Assets*. The various *semantic data models* describing each type of *MTConnect Asset* are defined in sub-*Part* documents (*Part 4.x*) of the MTConnect Standard.

*Part 5.0 – Interfaces:* Defines the MTConnect implementation of the *Interaction Model* used to coordinate actions between pieces of equipment used in manufacturing systems.

172    **4.2 MTConnect Document Versioning**

173    The MTConnect Standard will be periodically updated with new and expanded functionality.  
 174    Each new release of the Standard will include additional content adding new functionality and/or  
 175    extensions to the *semantic data models* defined in the Standard.

176    The MTConnect Standard uses a three-digit version numbering system to identify each release of  
 177    the Standard that indicates the progression of enhancements to the Standard. The format used to  
 178    identify the documents in a specific version of the MTConnect Standard is:

179    *major.minor.revision*

180    *major* – Identifier representing a consistent set of functionalities defined by the  
 181    MTConnect Standard. This functionality includes the protocol(s) used to communicate  
 182    data to a client software application, the *semantic data models* defining how that data is  
 183    organized into *Response Documents*, and the encoding of those *Response Documents*.  
 184    This set of functionalities is referred to as the *Base Functional Structure*.

185    When a release of the MTConnect Standard removes or modifies any of the protocol(s),  
 186    *semantic data models*, or encoding of the *Response Documents* included in the *Base*  
 187    *Functional Structure* in such a way that it breaks backward compatibility and a client  
 188    software application can no longer communicate with an *MTConnect Agent* or cannot  
 189    interpret the information provided by an *MTConnect Agent*, the *major* version identifier  
 190    for the Documents in the release is revised to a successively higher number.

191    See *Section 4.6 – Backwards Compatibility* for details regarding the interaction between a  
 192    client software application and versions of the MTConnect Standard.

193    *minor* – Identifier representing a specific set of functionalities defined by the MTConnect  
 194    Standard. Each release of the Standard (with a common *major* version identifier)  
 195    includes new and/or expanded functionality – protocol extensions, new or extended  
 196    *semantic data models*, and/or new programming languages. Each of these releases of the  
 197    Standard is indicated by a successively higher *minor* version identifier.

198    If a new *major* version of the MTConnect Standard is released, the *minor* version  
 199    identifier will be reset to 0.

200    *revision* – A supplemental identifier representing only organizational or editorial changes  
 201    to a *minor* version document with no changes in the functionality described in that  
 202    document.

203    New releases of a specific document are indicated by a successively higher *revision*  
 204    version identifier.

205    If a new *minor* version of a document is released, the *revision* identifier will be reset to 0.

206    An example of the Version identifier for a specific document would be:

207                      Version *M.N.R*

208 **4.2.1 Document Releases**

209 A *major* revision change represents a substantial change to the MTConnect Standard. At the  
210 time of a *major* revision change, all documents representing the MTConnect Standard will be  
211 updated and released together.

212 A *minor* revision change represents some level of extended functionality supported by the  
213 MTConnect Standard. At the time of a *minor* version release, MTConnect Documents  
214 representing the changes or enhancements to the Standard will be updated as required.  
215 However, all documents, whether updated or not, will be released together with a new *minor*  
216 version number. Providing all documents at a common *major* and *minor* version makes it easier  
217 for implementers to manage the compatibility and upgrade of the different software tools  
218 incorporated into a manufacturing software system.

219 Since a *revision* represents no functional changes to the MTConnect Standard and includes only  
220 editorial or descriptive changes that enhance the understanding of the functionality supported by  
221 the Standard, individual documents within the Standard may be released at any time with a new  
222 *revision* and that release does not impact any other documents associated with the MTConnect  
223 Standard.

224 The latest released version of each document provided for the MTConnect Standard, and  
225 historical releases of those documents, are provided at <http://www.mtconnect.org>.

## 226 4.3 MTConnect Document Naming Convention

227 MTCConnect Documents are identified as follows:

### 228 4.3.1 Document Title

229 Each MTConnect Document **MUST** be identified as follows:

## MTConnect® Standard

Part #. # - Title

Version *M.N.R*

236 The following keys are used to distinguish different *Parts* of the MTConnect Standard and the  
237 version of the MTConnect Document:

238 #.# – Identifier of the specific *Part* and sub-Part of the MTConnect Standard

239 Title – Description of the type of information contained in the MTConnect Document

240 M – Indicator of the major version of the MTConnect Document

241 N – Indicator of the minor version of the MTConnect Document

242 R – Indicator of the revision of the MTConnect Document

243 For example, a release of *Part 2.0 – Devices Information Model* would be:

## MTConnect® Standard

### Part 2.0 – Devices Information Model

Version 1.2.0

247

#### 4.3.2 Electronic Document File Naming

249 Electronic versions of the MTConnect Documents will be provided in PDF format. The naming  
250 convention of the electronic files representing each document will be identified as follows:

251 MTC\_Part\_#.#\_Title\_M.N.R.pdf

252 The same keys are used to distinguish the electronic documents as are defined above for the  
253 document title.

254 The electronic version of the same release of *Part 2.0 – Devices Information Model* would be:

255 MTC\_Part\_2.0\_Devices Information Model\_1.2.0.pdf

256

#### 4.4 Document Conventions

258 Additional information regarding specific content in the MTConnect Standard is provided in the  
259 sections below.

260

261 **4.4.1 Use of MUST, SHOULD, and MAY**

262 These words convey specific meaning in the MTConnect Standard when presented in capital  
263 letters, Times New Roman font, and a Bold font style.

- 264 • The word **MUST** indicates content that is mandatory to be provided in an  
265 implementation where indicated.
- 266 • The word **SHOULD** indicates content that is recommended, but the exclusion of which  
267 will not invalidate an implementation.
- 268 • The word **MAY** indicates content that is optional. It is up to the implementer to decide if  
269 the content is relevant to an implementation.
- 270 • The word **NOT** may be added to the words **MUST** or **SHOULD** to negate the  
271 requirement.

272 **4.4.2 Text Conventions**

273 The following conventions will be used throughout the MTConnect Documents to provide a  
274 clear and consistent understanding of the use of each type of information used to define the  
275 MTConnect Standard.

276

- 277 These conventions are:
- 278 • Standard text is provided in Times New Roman font.
  - 279 • References to documents, sections or sub-sections of a document, or figures within a  
280 document are *italicized*; e.g., *Part 2.0 – Devices Information Model*.
  - 281 • Terms with a specific meaning in the MTConnect Standard will be *italicized*; e.g., *major*  
282 indicating a version of the Standard.
  - 283 • When these same terms are used within the text without specific reference to their  
284 function within the MTConnect Standard, they will be provided as non-italicized font;  
285 e.g., major indicating a descriptor of another term.
  - 286 • Terms representing content of an MTConnect *semantic data model* or the protocol used  
287 in MTConnect will be provided in fixed size, Courier New font; e.g., component,  
288 probe, current.
- 289 When these same terms are used within the text without specific reference to their  
290 function within the MTConnect Standard, they will be provided as Times New  
291 Roman font.
- 292 • All *Valid Data Values* that are restricted to a limited or controlled vocabulary will be  
293 provided in upper case Courier New font with an \_ (underscore) separating words. For  
294 example: ON, OFF, ACTUAL, COUNTER\_CLOCKWISE, etc.
  - 295 • All descriptive attributes associated with each piece of data defined in a *Response*  
296 *Document* will be provided in Courier New font and camel case font style. For example:  
297 nativeUnits.

#### 298 **4.4.3 Code Line Syntax and Conventions**

- 299 The following conventions will be used throughout the MTConnect Documents to describe  
300 examples of software code produced by an *MTConnect Agent* or commands provided to an *Agent*  
301 from a client software application.
- 302 All examples are provided in fixed size Courier New font with line numbers.
- 303

304 These conventions are:

- 305 • XML Code examples:

306 1. <MTConnectStreams xmlns:m="urn:mtconnect.com:MTConnectStreams:1.1"  
 307 2. xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"  
 308 3. xmlns="urn:mtconnect.com:MTConnectStreams:1.1"

- 309 • HTTP URL examples:

310 – http://<authority>/<path>[?<query>] When a portion of a URL is enclosed in angle  
 311 brackets (“<” and “>”), that section of the URL is a place holder for specific  
 312 information that will replace the term between the angle brackets.

313 Note: The angle brackets in a URL do not relate to the angle brackets used as the  
 314 tag elements in an XML example.

- 315 – A portion of a URL that is enclosed in square brackets “[“ and “]” indicates that the  
 316 enclosed content is optional.  
 317 – All other characters in the URL are literal.

#### 318 4.4.4 Semantic Data Model Content

319 For each of the *semantic data models* defined in the MTConnect Standard, there are tables  
 320 describing pieces of information provided in the data models. Each table has a column labeled  
 321 *Occurrence*. *Occurrence* defines the number of times the content defined in the tables **MAY** be  
 322 provided in the usage case specified.

- 323 • If the *Occurrence* is 1, the content **MUST** be provided.
- 324 • If the *Occurrence* is 0..1, the content **MAY** be provided and if provided, at most, only  
 325 one occurrence of the content **MUST** be provided.
- 326 • If the *Occurrence* is 0..INF, the content **MAY** be provided and any number of  
 327 occurrences of the content **MAY** be provided.
- 328 • If the *Occurrence* is 1..INF, one or more occurrences of the content **MUST** be provided.
- 329 • If the *Occurrence* is a number, e.g., 2, exactly that number of occurrences of the content  
 330 **MUST** be provided.

#### 331 4.4.5 Referenced Standards and Specifications

332 Other standards and specifications may be used to describe aspects of the protocol, *data*  
 333 *dictionary*, or *semantic data models* defined in the MTConnect Standard. When a specific  
 334 standard or specification is referenced in the MTConnect Standard, the name of the standard or  
 335 specification will be provided in *italicized* font.

336 See *Appendix A: Bibliography* for a complete listing of standards and specifications used or  
 337 referenced in the MTConnect Standard.

338 **4.4.6 Deprecation and Deprecation Warnings**

339 When the MTConnect Institute adds new functionality to the MTConnect Standard, the new  
 340 content may supersede some of the functionality of existing content or significantly enhance one  
 341 of the *semantic data models*. When this occurs, existing content may no longer be valid for use  
 342 in the new version of the Standard.

343 **4.4.6.1 Deprecation**

344 In cases when new content supersedes the functionality of the existing content, the original  
 345 content **MUST** no longer be included in future implementations – only the new content should  
 346 be used.

347 The superseded content is identified by striking through the original content (~~original content~~)  
 348 and marking the content with the words “**DEPRECATED** in *Version M.N*”.

349 The deprecated content must remain in all future *minor* versions of the document. The content  
 350 may be removed when a *major* version update is released. This provides implementers guidance  
 351 on how to interpret data that may be provided from equipment utilizing an older version of the  
 352 Standard. This content provides the information required for implementers to develop software  
 353 applications that support backwards compatibility with older versions of the standard.

354 A software application may be designed to be compliant with any specific *minor* version of the  
 355 standard. That software application may be collecting data from many different pieces of  
 356 equipment. Each of these pieces of equipment may be providing data defined by the current  
 357 version or any of the previous *minor* versions of the standard. To maintain compatibility with  
 358 existing pieces of equipment, software applications should be implemented to interpret data  
 359 defined in the current release of the MTConnect Standard, as well as all deprecated content  
 360 associated with earlier versions of the Standard.

361 **4.4.6.2 Deprecation Warning**

362 When new content provides improved alternatives for defining the *semantic data models*, the  
 363 MTConnect Institute may determine that the original content could possibly be deprecated in the  
 364 future. When this occurs, a content will be marked with the words “**DEPRECATION**  
 365 **WARNING**” to identify the content that may be deprecated in the future. This provides  
 366 advanced notice to implementers that they should choose to utilize the improved alternatives  
 367 when developing new products or software systems to avoid the possibility that the original  
 368 content may be deprecated in a future version of the Standard.

369 **4.5 Document Version Management**

370 The MTConnect Institute establishes a balanced approach to determining when, or if, to release  
 371 an updated version of the MTConnect Standard. New versions of the MTConnect Standard will  
 372 be released periodically to extend the functionality defined by the Standard. It is a strategic  
 373 objective of the MTConnect Institute that new releases of the Standard must not occur too  
 374 frequently since each release may disrupt existing products and software systems. Decisions on  
 375 the timing and content of new versions of the Standard are determined by the MTConnect  
 376 Technical Advisory Group (TAG).

377 Any MTConnect Document designated with a new *major* and *minor* version number that  
 378 includes substantive changes requires a 90-day review of the new content in the document by the  
 379 TAG prior to the release of that document. This review period allows the TAG time to comment  
 380 on the recommended changes and to determine that the additional content provided in each  
 381 version is clearly defined. Additionally, the TAG review includes an assessment that the new  
 382 content is free from known intellectual property, patent, and copyright infringements.

383 If the TAG review identifies a need for additional substantive changes to any MTConnect  
 384 Document, that Document will be again updated and submitted for an additional 30-day review  
 385 period by the TAG. This process is repeated until a voting majority of the TAG approves each  
 386 Document to be considered as a release candidate for a new version of the MTConnect Standard.

387 If only editorial changes are made to an MTConnect Document, then a review of that document  
 388 is not required. However, upon the discretion of the Technical Steering Committee, a 30-day  
 389 review of the changed content may be requested.

390 Once all Documents associated with a planned release are reviewed and approved, the  
 391 MTConnect Institute will then seek approval for the release of the new version of the Standard  
 392 from the MTConnect Board of Trustees. After that, there will be a formal announcement of the  
 393 availability of a new release of the MTConnect Standard.

## 394 **4.6 Backwards Compatibility**

395 MTConnect Documents with a different *major* version identifier represent a significant change in  
 396 the *Base Functional Structure* of the MTConnect Standard. This means that the schema or  
 397 protocol defined by the Standard may have changed in ways that will require software  
 398 applications to change how they request and/or interpret data received from an *MTConnect*  
 399 *Agent*. Software applications should be fully version aware since no assumption of backwards  
 400 compatibility should be assumed at the time of a *major* revision change to the MTConnect  
 401 Standard.

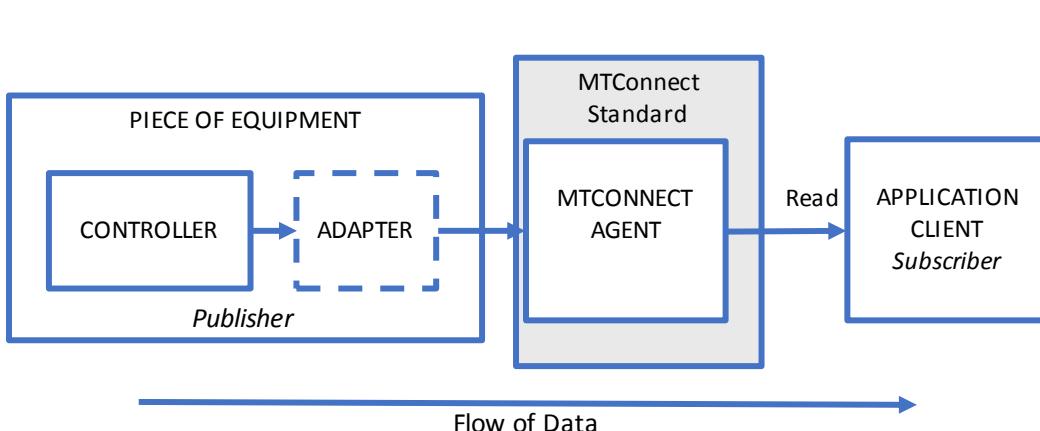

402 The MTConnect Institute strives to maintain version compatibility through all *minor* revisions of  
 403 the MTConnect Standard. New *minor* versions may introduce extensions to existing *semantic*  
 404 *data models*, extend the protocol used to communicate to the *MTConnect Agent*, and/or add new  
 405 *semantic data models* to extend the functionality of the Standard. Client software applications  
 406 may be designed to be compliant with any specific *minor* version of the MTConnect Standard.  
 407 Additionally, software applications should be capable of interpreting information from an  
 408 *MTConnect Agent* providing data based upon a lower *minor* version identifier. It should also be  
 409 capable of interpreting information from an *MTConnect Agent* providing data based upon a  
 410 higher *minor* version identifier of the MTConnect Standard than the version supported by the  
 411 client, even though the client may ignore or not be capable of interpreting the extended content  
 412 provided by the *MTConnect Agent*.

413 A *revision* version of any MTConnect Document provides only editorial changes requiring no  
 414 changes to an *MTConnect Agent* or a client application.

## 415 5 MTConnect Fundamentals

416 The MTConnect® Standard defines the functionality of an *MTConnect Agent*. In an MTConnect  
 417 installation, pieces of equipment publish information to an *MTConnect Agent*. Client software  
 418 applications request information from the *Agent* using a communications protocol. Based on the  
 419 specific information that the client software application has requested from the *Agent*, the *Agent*  
 420 forms a *Response Document* based upon one of the *semantic data models* defined in the  
 421 MTConnect Standard and then transmits that document to the client software application.

422 *Figure 2* below illustrates the architecture of a typical MTConnect installation.

424  
 425 **Figure 2: MTConnect Architecture Model**

426  
 427 Note: In each implementation of a communication system based on the MTConnect Standard,  
 428 there **MUST** be a *schema* defined that encodes the rules and terminology defined for  
 429 each of the *semantic data models*. These *schemas* **MAY** be used by client software  
 430 applications to validate the content and structure of the *Response Documents* published  
 431 by an *MTConnect Agent*.

### 432 5.1 MTConnect Agent

433 An *MTConnect Agent* is the centerpiece of an MTConnect implementation. It provides two  
 434 primary functions:

- 435 • Organizes and manages individual pieces of information published by one or more  
 436 pieces of equipment.
- 437 • Publishes that information in the form of a *Response Document* to client software  
 438 applications.

439 The MTConnect Standard addresses the behavior of an *MTConnect Agent* and the structure and  
 440 meaning of the data published by an *Agent*. It is the responsibility of the implementer of an  
 441 *MTConnect Agent* to determine the means by which the behavior is achieved for a specific  
 442 *Agent*.

443 An *MTConnect Agent* is software that may be installed as part of a piece of equipment or it may  
 444 be installed separately. When installed separately, an *Agent* may receive information from one or  
 445 more pieces of equipment.

446 Some pieces of equipment may be able to communicate directly to an *MTConnect Agent*. Other  
 447 pieces of equipment may require an *Adapter* to transform the information provided by the  
 448 equipment into a form that can be sent to an *Agent*. In either case, the method of transmitting  
 449 information from the piece of equipment to an *MTConnect Agent* is implementation dependent  
 450 and is not addressed as part of the MTConnect Standard.

451 One function of an *MTConnect Agent* is to store information that it receives from a piece of  
 452 equipment in an organized manner. A second function of an *MTConnect Agent* is to receive  
 453 *Requests* for information from one or many client software applications and then respond to  
 454 those *Requests* by publishing a *Response Document* that contains the requested information.

455 There are three types of information stored by an *MTConnect Agent* that **MAY** be published in a  
 456 *Response Document*. These are:

- 457 • *Equipment Metadata* defines the *Structural Elements* that represent the physical and  
 458 logical parts and sub-parts of each piece of equipment that can publish data to the *Agent*,  
 459 the relationships between those parts and sub-parts, and the *Data Entities* associated with  
 460 each of those *Structural Elements*. This *Equipment Metadata* is provided in an  
 461 *MTConnectDevices Response Document*. See *Part 2, Devices Information Model* for  
 462 more information on *Equipment Metadata*.
- 463 • *Streaming Data* provides the values published by pieces of equipment for the *Data*  
 464 *Entities* defined by the *Equipment Metadata*. *Streaming Data* is provided in an  
 465 *MTConnectStreams Response Document*. See *Part 2, Streams Information Model* for  
 466 more information on *Streaming Data*.
- 467 • *MTConnect Assets* represent information used in a manufacturing operation that is  
 468 commonly shared amongst multiple pieces of equipment and/or software applications.  
 469 *MTConnect Assets* are provided in an *MTConnectAssets Response Document*. See *Part*  
 470 *4, Assets Information Model* for more information on *MTConnect Assets*.

471 The exchange between an *MTConnect Agent* and a client software application is a *Request* and  
 472 *Response* information exchange mechanism. See *Section 5.4* for details on this  
 473 *Request/Response* information exchange mechanism.

#### 474 **5.1.1 Instance of an *MTConnect Agent***

475 As described above, an *MTConnect Agent* collects and organizes values published by pieces of  
 476 equipment. As with any piece of software, an *MTConnect Agent* may be periodically restarted.  
 477 When an *MTConnect Agent* restarts, it **MUST** indicate to client software applications whether  
 478 the information available in the *buffer* represents a completely new set of data or if the *buffer*  
 479 includes data that had been collected prior to the restart of the *Agent*.

480

481 Any time an *MTConnect Agent* is restarted and begins to collect a completely new set of  
 482 *Streaming Data*, that set of data is referred to as an *instance* of the *Agent*. The *MTConnect Agent*  
 483 **MUST** maintain a piece of information called `instanceId` that represents the specific  
 484 *instance* of the *Agent*.

485 `instanceId` is represented by a 64-bit integer. The `instanceId` **MAY** be implemented  
 486 using any mechanism that will guarantee that the value for `instanceId` will be unique each  
 487 time the *MTConnect Agent* begins collecting a new set of data.

488 When an *MTConnect Agent* is restarted and it provides a method to recover all, or some portion,  
 489 of the data that was stored in the *buffer* before it stopped operating, the *Agent* **MUST** use the  
 490 same `instanceId` that was defined prior to the restart.

### 491 **5.1.2 Storage of Equipment Metadata for a Piece of Equipment**

492 An *MTConnect Agent* **MUST** be capable of publishing *Equipment Metadata* for each piece of  
 493 equipment that publishes information through the *Agent*. *Equipment Metadata* is typically a  
 494 static file defining the *Structural Elements* associated with each piece of equipment reporting  
 495 information through the *Agent* and the *Data Entities* that can be associated with each of these  
 496 *Structural Elements*. See details on *Structural Elements* and *Data Entities* in *Part 2 - Devices*  
 497 *Information Model*.

498 The MTConnect Standard does not define the mechanism to be used by an *MTConnect Agent* to  
 499 acquire, maintain, or store the *Equipment Metadata*. This mechanism **MUST** be defined as part  
 500 of the implementation of a specific *MTConnect Agent*.

### 501 **5.1.3 Storage of Streaming Data**

502 *Streaming Data* that is published from a piece(s) of equipment to an *MTConnect Agent* is stored  
 503 by the *Agent* based upon the sequence upon which each piece of data is received. As described  
 504 below, the order in which data is stored by the *Agent* is one of the factors that determines the data  
 505 that may be included in a specific *MTConnectStreams Response Document*.

#### 506 **5.1.3.1 Management of Streaming Data Storage**

507 An *MTConnect Agent* stores a fixed amount of data. The amount of data stored by an *Agent* is  
 508 dependent upon the implementation of a specific *MTConnect Agent*. The examples below  
 509 demonstrate how discrete pieces of data received from pieces of equipment are stored.

510 The method for storing *Streaming Data* in an *MTConnect Agent* can be thought of as a tube that  
 511 can hold a finite set of balls. Each ball represents the occurrence of a *Data Entity* published by a  
 512 piece of equipment. This data is pushed in one end of the tube until there is no more room for  
 513 additional balls. At that point, any new data inserted will push the oldest data out the back of the  
 514 tube. The data in the tube will continue to shift in this manner as new data is received.

515

516 This tube is referred to as a *buffer* in an *MTConnect Agent*.

517

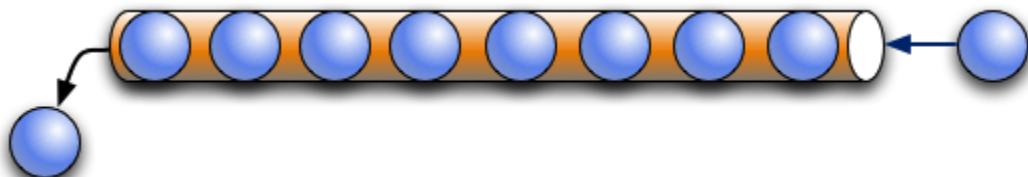

518

519

520 In the example below, the maximum number of *Data Entities* that can be stored in the *buffer* of  
521 the *MTConnect Agent* is 8. The maximum number of *Data Entities* that can be stored in the  
522 *buffer* is represented by a value called `bufferSize`. This example illustrates that when the  
523 *buffer* fills up, the oldest piece of data falls out the other end.

524

525

526 This process constrains the memory storage requirements for an *MTConnect Agent* to a fixed  
527 maximum size since the *MTConnect Standard* only requires an *Agent* to store a finite number of  
528 pieces of data.

529 As an implementation guideline, the *buffer* **SHOULD** be sized large enough to provide storage  
530 for a reasonable amount of information received from all pieces of equipment that are publishing  
531 information to that *MTConnect Agent*. The implementer should also consider the impact of a  
532 temporary loss of communications between a client software application and an *MTConnect*  
533 *Agent* when determining the size for the buffer. A larger buffer will allow a client software  
534 application more time to reconnect to an *Agent* without losing data.

### 535 5.1.3.2 Sequence Numbers

536 In an *MTConnect Agent*, each occurrence of a *Data Entity* in the *buffer* will be assigned a  
537 monotonically increasing *sequence number* as it is inserted into the *buffer*. The *sequence number*  
538 is a 64-bit integer and the values assigned as *sequence numbers* will never wrap around or be  
539 exhausted; at least within the next 100,000 years based on the size of a 64-bit number.

540 *Sequence number* is the primary key identifier used to manage and locate a specific piece of data  
541 in an *MTConnect Agent*. The *sequence number* associated with each *Data Entity* reported by an  
542 *MTConnect Agent* is identified with an attribute called `sequence`.

543

544 The *sequence number* for each piece of data **MUST** be unique for an *instance* of an *MTConnect*  
 545 *Agent* (see *Section 5.1.1* for information on *instances* of an *MTConnect Agent*). If data is  
 546 received from more than one piece of equipment, the sequence numbers are based on the order in  
 547 which the data is received regardless of which piece of equipment produced that data. The  
 548 *sequence number* **MUST** be a monotonically increasing number that spans all pieces of  
 549 equipment publishing data to an *Agent*. This allows for multiple pieces of equipment to publish  
 550 data through a single *MTConnect Agent* with no *sequence number* collisions and unnecessary  
 551 protocol complexity.

552 The *sequence number* **MUST** be reset to one (1) each time an *MTConnect Agent* is restarted and  
 553 begins to collect a fresh set of data; i.e., each time `instanceId` is changed.

554 The following example demonstrates the relationship between `instanceId` and `sequence`  
 555 when an *MTConnect Agent* stops and restarts and begins collecting a new set of data. In this  
 556 case, the `instanceId` is changed to a new value and value for `sequence` resets to one (1):

<code>instanceId</code>	<code>sequence</code>
<b>234556</b>	<b>234</b>
	<b>235</b>
	<b>236</b>
	<b>237</b>
	<b>238</b>

### Agent Stops and Restarts

<b>234557</b>	<b>1</b>
	<b>2</b>
	<b>3</b>
	<b>4</b>
	<b>5</b>

557

558 **Figure 3: `instanceId` and `sequence`**

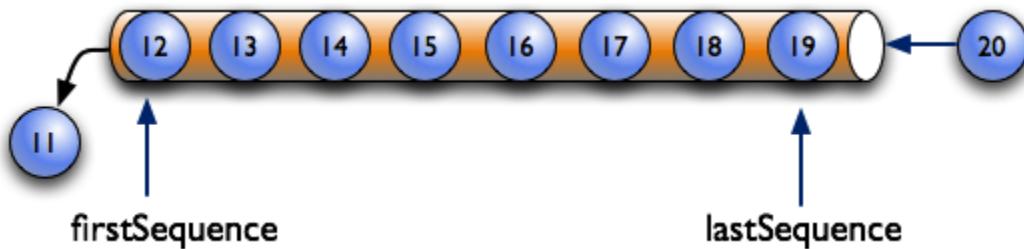

559

560 The example below also shows two additional pieces of information defined for an *MTConnect Agent*:  
 561

- 562 • *firstSequence* – the oldest piece of data contained in the *buffer*; i.e., the next piece  
 563 of data to be moved out of the *buffer*
- 564 • *lastSequence* – the newest data added to the *buffer*

565 *firstSequence* and *lastSequence* provide guidance to a software application identifying  
 566 the range of data available that may be requested from an *MTConnect Agent*.

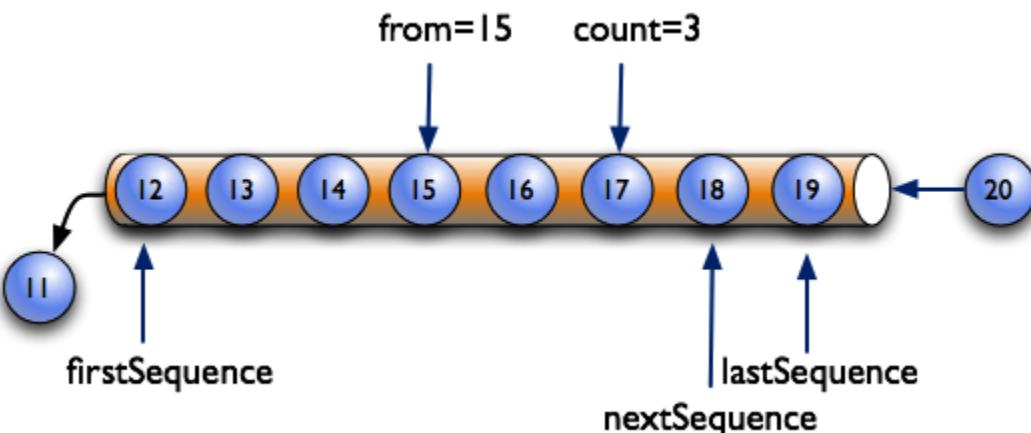

567

568

569 When a client software application requests data from an *MTConnect Agent*, it can specify both  
 570 the *sequence number* of the first piece of data (*from*) that **MUST** be included in the Response  
 571 Document and the total number (*count*) of pieces of data that **SHOULD** be included in that  
 572 document.

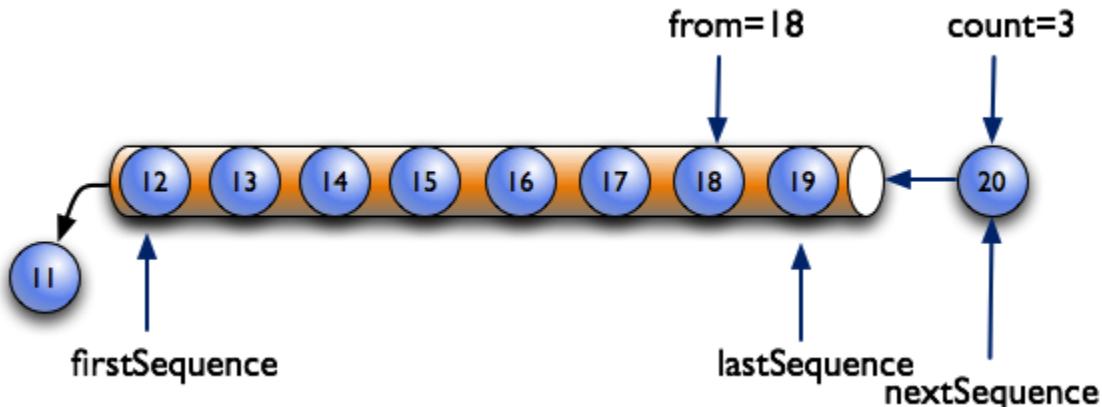

573 In the example below, the request specifies that the data to be returned starts at *sequence number*  
 574 15 (*from*) and includes a total of three items (*count*).

575

576 Once a *Response* to a *Request* has been completed, the value of *nextSequence* will be  
 577 established. *nextSequence* is the *sequence number* of the next piece of data available in the  
 578 *buffer*. In the above example, the next *sequence number* (*nextSequence*) will be 18.

579 As shown in the example below, the combination of `from` and `count` defined by the *Request*  
 580 indicates a *sequence number* for data that is beyond that which is currently in the *buffer*. In this  
 581 case, `nextSequence` is set to a value of `lastSequence + 1`.

582

### 5.1.3.3 Buffer Data Structure

584 The information in the *buffer* of an *MTConnect Agent* can be thought of as a four-column table of  
 585 data. Each column in the table represents:

- 586 • The first column is the *sequence number* associated with each *Data Entity* - `sequence`.
- 587 • The second column is the time that the data was published by a piece of equipment. This  
 588 time is defined as the `timestamp` associated with that *Data Entity*. See *Section 5.1.3.4*  
 589 for details on `timestamp`.
- 590 • The third column, `dataItemId`, refers to the identity of Data Entities as they will  
 591 appear in the *MTConnectStreams Response Document*. See *Section 5 of Part 3.0 –*  
 592 *Streams Information Model* for details on `dataItemId` for a *Data Entity* and how that  
 593 identify relates to the `id` attribute of the corresponding *Data Entity* in the *Devices*  
 594 *Information Model*.
- 595 • The fourth column is the value associated with each *Data Entity*.

596

597 The following is an example demonstrating the concept of how data may be stored in an  
 598 *MTConnect Agent*:

AGENT			
Seq	Time	dataItemId	Value
101	2016-12-13T09:44:00.2221	AVAIL-28277	UNAVAILABLE
102	2016-12-13T09:54:00.3839	AVAIL-28277	AVAILABLE
103	2016-12-13T10:00:00.0594	POS-Y-28277	25.348
104	2016-12-13T10:00:00.0594	POS-Z-28277	13.23
105	2016-12-13T10:00:03.2839	SS-28277	0

108	2016-12-13T10:01:37.8594	POS-Z-73746	1.143
109	2016-12-13T10:02:03.2617	SS-28277	1002

600 **Figure 4: Data Storage Concept**

601

602 The storage mechanism for the data, the internal representation of the data, and the  
 603 implementation of the *MTConnect Agent* itself is not part of the MTConnect Standard. The  
 604 implementer can choose both the amount of data to be stored in the *Agent* and the mechanism for  
 605 how the data is stored. The only requirement is that an *MTConnect Agent* publish the *Response*  
 606 *Documents* in the required format.

#### 607 **5.1.3.4 Time Stamp**

608 Each piece of equipment that publishes information to an *MTConnect Agent* **SHOULD** provide a  
 609 time stamp indicating when each piece of information was measured or determined. If no time  
 610 stamp is provided, the *Agent* **MUST** provide a time stamp for the information based upon when  
 611 that information was received at the *Agent*.

612 The timestamp associated with each piece of information is reported by an *MTConnect Agent* as  
 613 timestamp. timestamp **MUST** be reported in UTC (Coordinated Universal Time) format;  
 614 e.g., "2010-04-01T21:22:43Z".

615 Note: Z refers to UTC/GMT time, not local time.

616

617 Client software applications should use the value of `timestamp` reported for each piece of  
 618 information as the means for ordering when pieces of information were generated as opposed to  
 619 using sequence for this purpose.

620 Note: It is assumed that `timestamp` provides the best available estimate of the time that the  
 621 value(s) for the published information was measured or determined.

622 If two pieces of information are measured or determined at the exact same time, they **MUST** be  
 623 reported with the same value for `timestamp`. Likewise, all information that is recorded in the  
 624 *buffer* with the same value for `timestamp` should be interpreted as having been recorded at the  
 625 same point in time; even if that data was published by more than one piece of equipment.

### 626 **5.1.3.5 Recording Occurrences of Streaming Data**

627 An *MTConnect Agent* **MUST** record data in the *buffer* each time the value for that specific piece  
 628 of data changes. If a piece of equipment publishes multiple occurrences of a piece of data with  
 629 the same value, the *Agent* **MUST NOT** record multiple occurrence for that Data Entity.

630 Note: There is one exception to this rule. Some Data Entities may be defined with a  
 631 representation attribute value of `DISCRETE` (See *Section 7.2.2.12 of Part 2.0*  
 632 *Devices Information Model* for details on representation.) In this case, each  
 633 occurrence of the data represents a new and unique piece of information. The  
 634 *MTConnect Agent* **MUST** then record each occurrence of the *Data Entity* that is  
 635 published by a piece of equipment.

636 The value for each piece of information reported by an *MTConnect Agent* must be considered by  
 637 a client software application to be valid until such a time that another occurrence of that piece of  
 638 information is published by the *Agent*.

### 639 **5.1.3.6 Maintaining Last Value for Data Entities**

640 An *MTConnect Agent* **MUST** retain a copy of the last available value associated with each *Data*  
 641 *Entity* known to the *Agent*; even if an occurrence of that *Data Entity* is no longer in the *buffer*.  
 642 This function allows an *MTConnect Agent* to provide a software application a view of the last  
 643 known value for each *Data Entity* associated with a piece of equipment.

644 The *MTConnect Agent* **MUST** also retain a copy of the last value associated with each *Data*  
 645 *Entity* that has flowed out of the *buffer*. This function allows an *MTConnect Agent* to provide a  
 646 software application a view of the last known value for each *Data Entity* associated with a  
 647 *Current Request* with an `@` parameter in the `query` portion of its *HTTP Request Line* (See  
 648 *Section 8.3.2* for details on *Current Request*).

### 649 **5.1.3.7 Unavailability of Data**

650 An *MTConnect Agent* **MUST** maintain a list of *Data Entities* that **MAY** be published by each  
 651 piece of equipment providing information to the *Agent*. This list of *Data Entities* is derived  
 652 from the *Equipment Metadata* stored in the *Agent* for each piece of equipment.

653

654 Each time an *MTConnect Agent* is restarted, the *Agent* **MUST** place an occurrence of every *Data Entity*  
 655 in the *buffer*. The value reported for each of these *Data Entities* **MUST** be set to  
 656 UNAVAILABLE and the timestamp for each **MUST** be set to the time that the last piece of  
 657 data was collected by the *Agent* prior to the.

658 If at any time an *MTConnect Agent* loses communications with a piece of equipment, or the  
 659 *Agent* is unable to determine a valid value for all, or any portion, of the *Data Entities* published  
 660 by a piece of equipment, the *Agent* **MUST** place an occurrence of each of these *Data Entities* in  
 661 the *buffer* with its value set to UNAVAILABLE. This signifies that the value is currently  
 662 indeterminate and no assumptions of a valid value for the data is possible.

663 Since an *MTConnect Agent* may receive information from multiple pieces of equipment, it  
 664 **MUST** consider the validity of the data from each of these pieces of equipment independently.

665 There is one exception to the rules above. Any *Data Entity* that is constrained to a constant data  
 666 value **MUST** be reported with the constant value and the *MTConnect Agent* **MUST NOT** set the  
 667 value of that *Data Entity* to UNAVAILABLE.

668 Note: The schema for the *Devices Information Model* (defined in *Part 2.0 - Devices*  
 669 *Information Model*) defines how the value reported for an individual piece of data may  
 670 be constrained to one or more specific values.

#### 671 5.1.3.8 Data Persistence and Recovery

672 The implementer of an *MTConnect Agent* must decide on a strategy regarding the storage of  
 673 *Streaming Data* in the *buffer* of the *Agent*.

674 In the simplest form, an *MTConnect Agent* can hold the *buffer* information in volatile memory  
 675 where no data is persisted when the *Agent* is stopped. In this case, the *Agent* **MUST** update the  
 676 value for `instanceId` when the *Agent* restarts to indicate that the *Agent* has begun to collect a  
 677 new set of data.

678 If the implementation of an *MTConnect Agent* provides a method of persisting and restoring all  
 679 or a portion of the information in the *buffer* of the *Agent* (*sequence numbers, timestamps,*  
 680 *identify, and values*), the *Agent* **MUST NOT** change the value of the `instanceId` when the  
 681 *Agent* restarts. This will indicate to a client software application that it does not need to reset the  
 682 value for `nextSequence` when it requests the next set of data from the *Agent*.

683 When an implementer chooses to provide a method to persist the information in an *MTConnect*  
 684 *Agent*, they may choose to store as much data as is practical in a recoverable storage system.  
 685 Such a method may also include the ability to store historical information that has previously  
 686 been pushed out of the *buffer*.

687

688 **5.1.3.9 Heartbeat**

689 An *MTConnect Agent* **MUST** provide a function that indicates to a client application that the  
 690 HTTP connection is still viable during times when there is no new data available to report in a  
 691 *Response Document*. This function is defined as *heartbeat*.

692 *Heartbeat* represents the amount of time after a *Response Document* has been published until a  
 693 new *Response Document* **MUST** be published, even when no new data is available.

694 See *Section 8.3.2.2* for more details on configuring the *heartbeat* function.

695 **5.1.4 Storage of Documents for *MTConnect Assets***

696 An *MTConnect Agent* also stores information associated with *MTConnect Assets*.

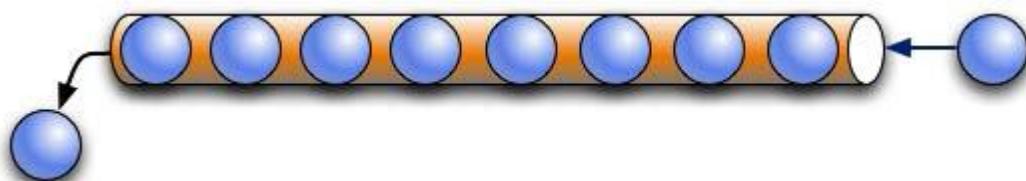

697 When a piece of equipment publishes a document that represents information associated with an  
 698 *MTConnect Asset*, an *MTConnect Agent* stores that document in a *buffer*. This *buffer* is called  
 699 the *assets buffer*. The document is called an *Asset Document*.

700 The *assets buffer* **MUST** be a separate *buffer* from the one where the *Streaming Data* is stored.

701 The *Assets Document* that is published by the piece of equipment **MUST** be organized based  
 702 upon one of the applicable *Asset Information Models* defined in one of the *Parts 4.x* of the  
 703 *MTConnect Standard*.

704 An *MTConnect Agent* will only retain a limited number of *Asset Documents* in the *assets buffer*.  
 705 The *assets buffer* functions similar to the *buffer* for *Streaming Data*; i.e., when the *assets buffer*  
 706 is full, the oldest *Assets Document* is pushed from the *buffer*.

707 The figure below demonstrates the oldest *Assets Document* being pushed from the *assets buffer*  
 708 when a new *Assets Document* is added and the *assets buffer* is full:

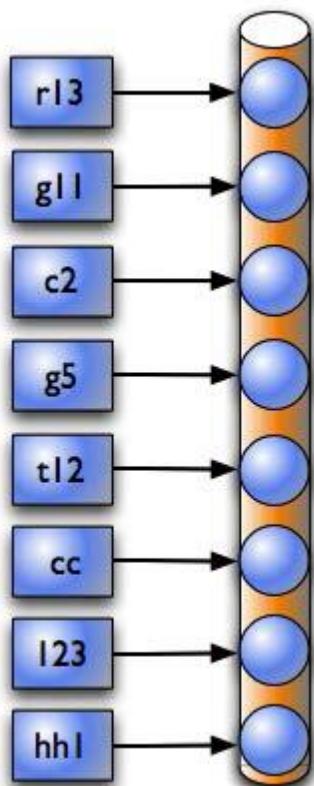

709

710 Within an *MTConnect Agent*, the management of *Asset Documents* behave like a key/value  
 711 storage in a database. In the case of *MTConnect Assets*, the key is an identifier for an *Asset* (see  
 712 details on `assetId` in *Part 4.0 - Assets Information Model*) and the value is the *Asset*  
 713 *Document* that was published by the piece of equipment.

714

715 The figure below demonstrates the relationship between the key (`assetId`) and the stored *Asset*  
 716 *Documents*:

717  
 718 Note: The key (`assetId`) is independent of the order of the *Asset Documents* stored in the  
 719 *assets buffer*.

720 When an *MTConnect Agent* receives a new *Asset Document* representing an *MTConnect Asset*, it  
 721 must determine whether this document represents an *MTConnect Asset* that is not currently  
 722 represented in the *assets buffer* or if the document represents new information for an *MTConnect*  
 723 *Asset* that is already represented in the *assets buffer*. When a new *Asset Document* is received,  
 724 one of the following **MUST** occur:

- 725 • If the *Asset Document* represents an *MTConnect Asset* that is not currently represented in  
 726 the *assets buffer*, the *Agent* **MUST** add the new document to the front of the *assets*  
 727 *buffer*. If the *assets buffer* is full, the oldest *Asset Document* will be removed from the  
 728 *assets buffer*.
- 729 • If the *Asset Document* represents an *MTConnect Asset* that is already represented in the  
 730 *assets buffer*, the *Agent* **MUST** remove the existing *Assets Document* representing that  
 731 *MTConnect Asset* from the *assets buffer* and add the new *Assets Document* to the front of  
 732 the *assets buffer*.

733

734 The MTConnect Standard does not specify the maximum number of *Asset Documents* that may  
 735 be stored in the *assets buffer*; that limit is determined by the implementation of a specific  
 736 *MTConnect Agent*. The number of *Asset Documents* that may be stored in an *MTConnect Agent*  
 737 is defined by the value for *assetBufferSize* (See *Section 6.5, Document Header* for more  
 738 information on *assetBufferSize*). A value of 4,294,967,296 or  $2^{32}$  can be provided for  
 739 *assetBufferSize* to indicate unlimited storage.

740 There is no requirement for an *MTConnect Agent* to provide persistence for the *Asset Documents*  
 741 stored in the *assets buffer*. If an *MTConnect Agent* should fail, all *Asset Documents* stored in the  
 742 *assets buffer* **MAY** be lost. It is the responsibility of the implementer to determine if *Asset*  
 743 *Documents* stored in an *MTConnect Agent* may be restored or if those *Asset Documents* are  
 744 retained by some other software application.

745 Additional details on how an *MTConnect Agent* organizes and manages information associated  
 746 with *MTConnect Assets* are provided in *Part 4.0 – Assets Information Model*.

## 747 **5.2 Response Documents**

748 *Response Documents* are electronic documents generated and published by an *MTConnect Agent*  
 749 in response to a *Request* for data.

750 The *Response Documents* defined in the MTConnect Standard are:

- 751 • *MTConnectDevices*: An electronic document that contains the information published by an  
 752 *MTConnect Agent* describing the data that can be published by one or more piece(s) of  
 753 equipment. The structure of the *MTConnectDevices* document is based upon the  
 754 requirements defined by the *Devices Information Model*. See *Part 2.0 – Devices*  
 755 *Information Model* for details on this information model.
- 756 • *MTConnectStreams*: An electronic document that contains the information published by an  
 757 *MTConnect Agent* that contains the data that is published by one or more piece(s) of  
 758 equipment. The structure of the *MTConnectStreams* document is based upon the  
 759 requirements defined by the *Streams Information Model*. See *Part 3.0 – Streams*  
 760 *Information Model* for details on this information model.
- 761 • *MTConnectAssets*: An electronic document that contains the information published by an  
 762 *MTConnect Agent* that **MAY** include one or more *Asset Documents*. The structure of the  
 763 *MTConnectAssets* document is based upon the requirements defined by the *Assets*  
 764 *Information Model*. See *Part 4.0 – Assets Information Model* for details on this information  
 765 model.
- 766 • *MTConnectError*: An electronic document that contains the information provided by an  
 767 *MTConnect Agent* when an error has occurred when trying to respond to a *Request* for data.  
 768 The structure of the *MTConnectError* document is based upon the requirements defined by  
 769 the *Errors Information Model*. See *Section 9* of this document for details on this  
 770 information model.

771

772 *Response Documents* may be represented by any document format supported by an *MTConnect*  
 773 *Agent*. No matter what document format is used to structure these documents, the requirements  
 774 for representing the data and other information contained in those documents **MUST** adhere to  
 775 the requirements defined in the *Information Models* associated with each document.

## 776 5.2.1 XML Documents

777 XML is currently the only document format supported by the MTConnect Standard for encoding  
 778 *Response Documents*. Other document formats may be supported in the future.

779 Since XML is the document format supported by the MTConnect Standard for encoding  
 780 documents, all examples demonstrating the structure of the *Response Documents* provided  
 781 throughout the MTConnect Standard are based on XML. These documents will be referred to as  
 782 *MTConnect XML Documents* or *XML Documents*.

783 *Section 6, XML Representation of Response Documents* defines how each document is structured  
 784 as an XML document.

## 785 5.3 Semantic Data Models

786 A *semantic data model* is a software engineering method for representing data where the context  
 787 and the meaning of the data is constrained and fully defined.

788 Each of the *semantic data models* defined by the MTConnect Standard include:

- 789 • The types of information that may be published by a piece of equipment,
- 790 • The meaning of that information and units of measure, if applicable,
- 791 • Structural information that defines how different pieces of information relate to each  
 792 other, and
- 793 • Structural information that defines how the information relates to where the information  
 794 was measured or generated by the piece of equipment.

795 As described previously, the content of the *Response Documents* provided by an *MTConnect*  
 796 *Agent* are each defined by a specific *semantic data model*. The details for the *semantic data*  
 797 *model* used to define each of the *Response Documents* are detail as follows:

- 798 • *MTConnectDevices: Part 2.0 - Devices Information Model.*
- 799 • *MTConnectStreams: Part 3.0 - Streams Information Model.*
- 800 • *MTConnectAssets: Part 4.0 - Assets Information Model* and its sub-Parts.
- 801 • *MTConnectError: Part 1.0 - Overview and Fundamentals, Section 9, Errors*  
 802 *Information Model.*

803 Without semantics, a single piece of data does not convey any relevant meaning to a person or a  
 804 client software application. However, when that piece of data is paired with some semantic  
 805 context, the data inherits significantly more meaning. The data can then be more completely  
 806 interpreted by a client software application without human intervention.

807 The MTConnect *semantic data models* allows the information published by a piece of equipment  
 808 to be transmitted to client software application with a full definition of the meaning of that  
 809 information and in full context defining how that information relates to the piece of equipment  
 810 that measured or generated the information.

## 811 **5.4 Request/Response Information Exchange**

812 The transfer of information between an *MTConnect Agent* and a client software application is  
 813 based on a *Request/Response* information exchange approach. A client software application  
 814 requests specific information from an *MTConnect Agent*. An *MTConnect Agent* responds to the  
 815 *Request* by publishing a *Response Document*.

816 In normal operation, there are four types of *MTConnect Requests* that can be issued by a client  
 817 software application that will result in different *Responses* by an *MTConnect Agent*. These  
 818 *Requests* are:

- 819 • *Probe Request*—A client software application requests the *Equipment Metadata* for each  
 820 piece of equipment that **MAY** publish information through an *MTConnect Agent*. The  
 821 *Agent* publishes a *MTConnectDevices Response Document* that contains the requested  
 822 information. A *Probe Request* is represented by the term `probe` in a *Request* from a  
 823 client software application.
- 824 • *Current Request* – A client software application requests the current value for each of the  
 825 data types that have been published from a piece(s) of equipment to an *MTConnect*  
 826 *Agent*. The *Agent* publishes a *MTConnectStreams Response Document* that contains the  
 827 requested information. A *Current Request* is represented by the term `current` in a  
 828 *Request* from a client software application.
- 829 • *Sample Request* – A client software application requests a series of data values from the  
 830 *buffer* in an *MTConnect Agent* by specifying a range of *sequence numbers* representing  
 831 that data. The *Agent* publishes a *MTConnectStreams Response Document* that contains  
 832 the requested information. A *Sample Request* is represented by the term `sample` in a  
 833 *Request* from a client software application.
- 834 • *Asset Request* – A client software application requests information related to *MTConnect*  
 835 *Assets* that has been published to an *MTConnect Agent*. The *Agent* publishes an  
 836 *MTConnectAssets Response Document* that contains the requested information. An  
 837 *Asset Request* is represented by the term `asset` in a *Request* from a client software  
 838 application.

839 Note: If an *MTConnect Agent* is unable to respond to the request for information or the  
 840 request includes invalid information, the *Agent* will publish an *MTConnectError*  
 841 *Response Document*. See *Section 9* for information regarding *MTConnect Error*  
 842 *Information Model*.

843 The specific format for the *Request* for information from an *MTConnect Agent* will depend on  
 844 the *Protocol* implemented as part of the *Request/Response Information Exchange* mechanism  
 845 deployed in a specific implementation. See *Section 7, Protocol* for details on implementing the  
 846 *Request/Response Information Exchange*.

847 Also, the specific format for the *Response Documents* may also be implementation dependent.  
 848 See *Section 6, XML Representation of Response Document Structure* for details on the format for  
 849 the *Response Documents* encoded with XML.

## 850 **5.5 Accessing Information from an *MTConnect Agent***

851 Each of the *Requests* defined for the *Request/Response Information Exchange* requires an  
 852 *MTConnect Agent* to respond with a specific view of the information stored by the *Agent*. The  
 853 following describes the relationships between the information stored by an *Agent* and the  
 854 contents of the *Response Documents*.

### 855 **5.5.1 Accessing *Equipment Metadata* from an *MTConnect Agent***

856 The *Equipment Metadata* associated with each piece of equipment that publishes information to  
 857 an *MTConnect Agent* is typically static information that is maintained by the *Agent*. The  
 858 *MTConnect Standard* does not define how the *Agent* captures or maintains that information. The  
 859 only requirement that the *MTConnect Standard* places on an *MTConnect Agent* regarding this  
 860 *Equipment Metadata* is that the *Agent* properly store this information and then configure and  
 861 publish a *MTConnectDevices Response Document* in response to a *Probe Request*.

862 All issues associated with the capture and maintenance of the *Equipment Metadata* is the  
 863 responsibility of the implementer of a specific *MTConnect Agent*.

### 864 **5.5.2 Accessing *Streaming Data* from the *Buffer* of an *MTConnect Agent***

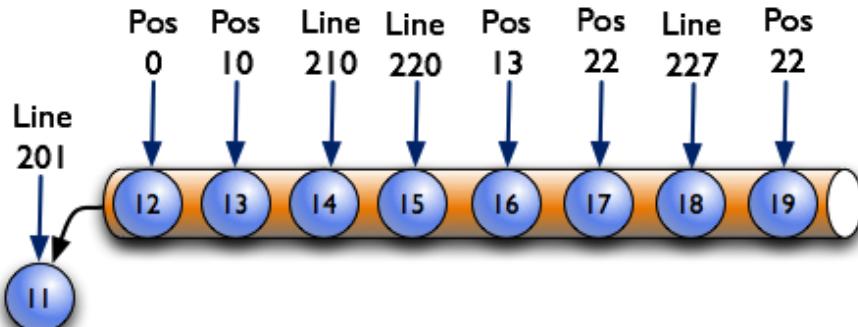

865 There are two *Requests* defined for the *Request/Response Information Exchange* that require an  
 866 *MTConnect Agent* to provide different views of the information stored in the buffer of the *Agent*.  
 867 These *Requests* are current and sample.

868 The example below demonstrates how an *MTConnect Agent* interprets the information stored in  
 869 the *buffer* to provide the content that is published in different versions of the *MTConnectStreams*  
 870 *Response Document* based on the specific *Request* that is issued by a client software application.

871 For this example, we are demonstrating an *MTConnect Agent* with a *buffer* that can hold up to  
 872 eight (8) *Date Entities*; i.e., the value for *bufferSize* is 8. This *Agent* is collecting  
 873 information for two pieces of data – *Pos* representing a position and *Line* representing a line of  
 874 logic or commands in a control program.

875

876 In this *buffer*, the value for `firstSequence` is 12 and the value for `lastSequence` is 19.  
 877 There are five (5) different values for `Pos` and three (3) different values for `Line`.

878

**Figure 5: Example Buffer**

880 If an *MTConnect Agent* receives a *Sample Request* from a client software application, the *Agent*  
 881 **MUST** publish an *MTConnectStreams Response Document* that contains a range of data values.  
 882 The range of values are defined by the `from` and `count` parameters that must be included as  
 883 part of the *Sample Request*. If the value of `from` is 14 and the value of `count` is 5, the *Agent*  
 884 **MUST** publish an *MTConnectStreams Response Document* that includes five (5) pieces of data  
 885 represented by *sequence numbers* 14, 15, 16, 17, and 18 – three (3) occurrences of `Line` and  
 886 two (2) occurrences of `Pos`. In this case, `nextSequence` will also be returned with a value of  
 887 19.

888 Likewise, if the same *MTConnect Agent* receives a *Current Request* from a client software  
 889 application, the *Agent* **MUST** publish an *MTConnectStreams Response Document* that contains  
 890 the most current information available for each of the types of data that is being published to the  
 891 *Agent*. In this case, the specific data that **MUST** be represented in the *MTConnectStreams*  
 892 *Response Document* is `Pos` with a value of 22 and a *sequence number* of 19 and `Line` with a  
 893 value of 227 and a *sequence number* of 18.

894 There is also a derivation of the *Current Request* that will cause an *Agent* to publish an  
 895 *MTConnectStreams Response Document* that contains a set of data relative to a specific *sequence*  
 896 *number*. The *Current Request* **MAY** include an additional parameter called `at`. When the `at`  
 897 parameter, along with an `instanceId`, is included as part of a *Current Request*, an *MTConnect*  
 898 *Agent* **MUST** publish an *MTConnectStreams Response Document* that contains the most current  
 899 information available for each of the types of *Data Entities* that are being published to the *Agent*  
 900 that occur immediately at or before the *sequence number* specified with the `at` parameter.

901 For example, if the *Request* is `current?at=15`, an *MTConnect Agent* **MUST** publish a  
 902 *MTConnectStreams Response Document* that contains the most current information available for  
 903 each of the *Data Entities* that are stored in the *buffer* of the *Agent* with a *sequence number* of 15  
 904 or lower. In this case, the specific data that **MUST** be represented in the *MTConnectStreams*  
 905 *Response Document* is `Pos` with a value of 10 and a *sequence number* of 13 and `Line` with a  
 906 value of 220 and a *sequence number* of 15.

907 If a current *Request* is received for a *sequence number* of 11 or lower, an *MTConnect Agent*  
908 **MUST** return an `OUT_OF_RANGE` *MTConnectError Response Document*. The same *HTTP*  
909 *Error Message* **MUST** be given if a *sequence number* is requested that is greater than the end of  
910 the *buffer*. See *Section 9* for more information on *MTConnect Error Response Document*.

### 911 **5.5.3 Accessing MTConnect Assets Information from an MTConnect Agent**

912 When an *MTConnect Agent* receives an *Asset Request*, the *Agent* **MUST** publish an  
913 *MTConnectAssets* document that contains information regarding the *Asset Documents* that  
914 are stored in the *Agent*.

915 See *Part 4.0 - Assets Information Model* for details on *MTConnect Assets*, *Asset Requests*, and  
916 the *MTConnectAssets Response Document*.

## 6 XML Representation of Response Documents

As defined in *Section 5.2.1*, XML is currently the only language supported by the MTConnect® Standard for encoding *Response Documents*.

*Response Documents* must be valid and conform to the *schema* defined in the *semantic data model* defined for that document. The schema for each *Response Document* **MUST** be updated to correlate to a specific version of the MTConnect Standard. Versions, within a *major version*, of the MTConnect Standard will be defined in such a way to best maintain backwards compatibility of the *semantic data models* through all *minor* revisions of the Standard. However, new *minor* versions may introduce extensions or enhancements to existing *semantic data models*.

To be valid, a *Response Document* must be well-formed; meaning that, amongst other things, each element has the required XML *start-tag* and *end-tag* and that the document does not contain any illegal characters. The validation of the document may also include a determination that required elements and attributes are present, they only occur in the appropriate location in the document, and they appear only the correct number of times. If the document is not well-formed, it may be rejected by a client software application. The *semantic data model* defined for each *Response Document* also specifies the elements and *Child Elements* that may appear in a document. XML elements may contain *Child Elements*, CDATA, or both. The *semantic data model* also defines the number of times each element and *Child Element* may appear in the document.

Each *Response Document* encoded using XML consists of the following primary sections:

- XML Declaration
- Root Element
- Schema and Namespace Declaration
- Document Header
- Document Body

The following will provide details defining how each of the *Response Documents* are encoded using XML.

Note: See *Section 3, Terminology* for the definition of XML related terms used in the MTConnect Standard.

## 6.1 Fundamentals of Using XML to Encode Response Documents

The MTConnect Standard follows industry conventions for formatting the elements and attributes included in an XML document. The general guidelines are as follows:

- All element names **MUST** be specified in Pascal case (first letter of each word is capitalized). For example: <PowerSupply/>.
- The name for an attribute **MUST** be Camel case; similar to Pascal case, but the first letter will be lower case. For example: <MyElement nativeName="bob"/> where MyElement is the *Element Name* and nativeName is an attribute.
- All CDATA values that are defined with a limited or controlled vocabulary **MUST** be in upper case with an \_ (underscore) separating words. For example: ON, OFF, ACTUAL, and COUNTER\_CLOCKWISE .
- The values provided for a date and/or a time **MUST** follow the W3C ISO 8601 format with an arbitrary number of decimals representing fractions of a second. Refer to the following specification for details on the format for dates and times:  
<http://www.w3.org/TR/NOTE-datetime>.

The format for the value describing a date and a time will be YYYY-MM-DDThh:mm:ss.ffff. An example would be: 2017-01-13T13:01.213415Z.

Note: Z refers to UTC/GMT time, not local time.

The accuracy and number of decimals representing fractions of a second for a timestamp **MUST** be determined by the capabilities of the piece of equipment publishing information to an *MTConnect Agent*. All time values **MUST** be provided in UTC (GMT).

- XML element names **MUST** be spelled out and abbreviations are not permitted. See the exclusion below regarding the use of the suffix Ref.
- XML attribute names **SHOULD** be spelled out and abbreviations **SHOULD** be avoided. The exception to this rule is the use of id when associated with an identifier. See the exclusion below regarding the use of the suffix Ref.
- The abbreviation Ref for Reference is permitted as a suffix to element names of either a *Structural Element* or a *Data Entity* to provide an efficient method to associate information defined in another location in a *Data Model* without duplicating that original data or structure. See *Section 4.8 in Part 2, Devices Information Model* for more information on Reference.

980 **6.2 XML Declaration**

981 The first section of a *Response Document* encoded with XML **SHOULD** be the *XML*  
 982 *Declaration*. The declaration is a single element.

983 An example of an XML Declaration would be:

984 2. <?xml version="1.0" encoding="UTF-8"?>

985 This element provides information regarding how the XML document is encoded and the  
 986 character type used for that encoding. See the W3C website for more details on the XML  
 987 declaration.

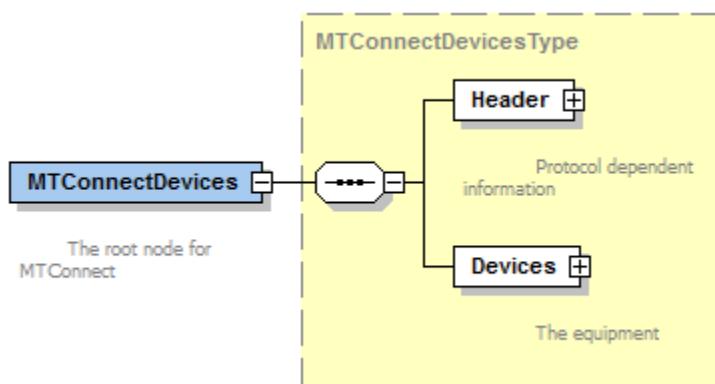

988 **6.3 Root Element**

989 Every *Response Document* **MUST** contain only one root element. The MTConnect Standard  
 990 defines MTConnectDevices, MTConnectStreams, MTConnectAssets, and  
 991 MTConnectError as *Root Elements*.

992 The *Root Element* specifies a specific *Response Document* and appears at the top of the  
 993 document immediately following the *XML Declaration*.

994 **6.3.1 MTConnectDevices Root Element**

995 MTConnectDevices is the *Root XML Element* for the *MTConnectDevices Response*  
 996 *Document*.

997

998 **Figure 6: MTConnectDevices Structure**

999

1000 MTConnectDevices **MUST** contain two *Child Elements* - Header and Devices. Details  
 1001 for Header are defined in *Section 6.5, Document Header*.

1002 Devices is an XML container that represents the *Document Body* for an *MTConnectDevices*  
 1003 *Response Document* – see *Section 6.6*. Details for the *semantic data model* describing the  
 1004 contents for Devices are defined in *Part 2.0 - Devices Information Model*.

1005 MTConnectDevices also has a number of attributes. These attributes are defined in *Section  
1006 6.4, Schema and Namespace Declaration.*

1007 **6.3.1.1 MTConnectDevices Elements**

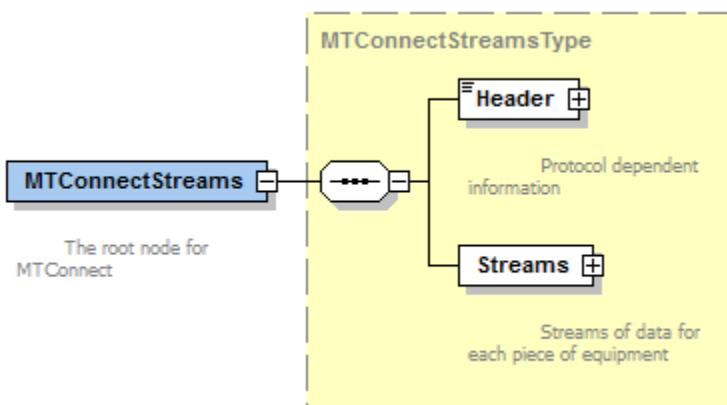

1008 An MTConnectDevices element **MUST** contain a Header and a Devices element.

Element	Description	Occurrence
Header	An XML container in an <i>MTConnect Response Document</i> that provides information from an <i>MTConnect Agent</i> defining version information, storage capacity, and parameters associated with the data management within the <i>Agent</i> .	1
Devices	The XML container in an <i>MTConnectDevices Response Document</i> that provides the <i>Equipment Metadata</i> for each of the pieces of equipment associated with an <i>MTConnect Agent</i> .	1

1009

1010 **6.3.2 MTConnectStreams Root Element**

1011 MTConnectStreams is the *Root Element* for the *MTConnectStreams Response Document*.

1012

1013 **Figure 7: MTConnectStreams Structure**

1014

1015 MTConnectStreams **MUST** contain two *Child Elements* - Header and Streams.

1016 Details for Header are defined in *Section 6.5, Document Header*.

1017 Streams is an XML container that represents the *Document Body* for a *MTConnectStreams  
1018 Response Document* – see *Section 6.6*. Details for the *semantic data model* describing the  
1019 contents for Streams are defined in *Part 3.0 - Streams Information Model*.

1020 MTConnectStreams also has a number of attributes. These attributes are defined in *Section  
1021 6.4, Schema and Namespace Declaration*.

1022 **6.3.2.1 MTConnectStreams Elements**

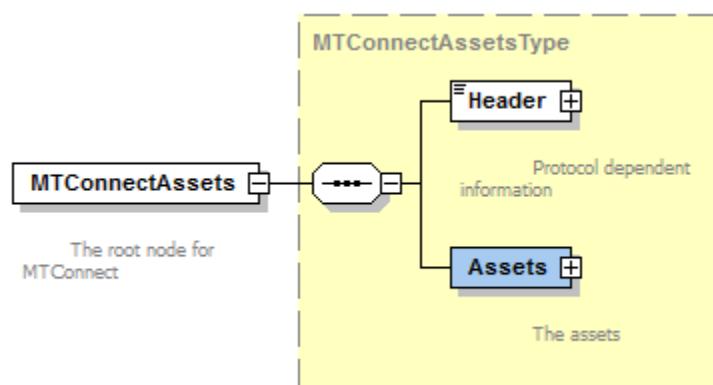

1023 An MTConnectStreams element **MUST** contain a Header and a Streams element.

Element	Description	Occurrence
Header	An XML container in an <i>MTConnect Response Document</i> that provides information from an <i>MTConnect Agent</i> defining version information, storage capacity, and parameters associated with the data management within the <i>Agent</i> .	1
Streams	The XML container for the information published by an <i>MTConnect Agent</i> in a <i>MTConnectStreams Response Document</i> .	1

1024

1025 **6.3.3 MTConnectAssets Root Element**

1026 MTConnectAssets is the *Root Element* for the *MTConnectAssets Response Document*.

1027

Figure 8: **MTConnectAssets Structure**

1029

1030 MTConnectAssets **MUST** contain two *Child Elements* - Header and Assets.

1031 Details for Header are defined in *Section 6.5, Document Header*.

1032 Assets is an XML container that represents the *Document Body* for an *MTConnectAssets Response Document* – see *Section 6.6*. Details for the *semantic data model* describing the contents for Assets are defined in *Part 4.0 - Assets Information Model*.

1035 MTConnectAssets also has a number of attributes. These attributes are defined in *Section 6.4, Schema and Namespace Declaration*.

1037

1038 **6.3.3.1 MTConnectAssets Elements**

1039 An MTConnectAssets element **MUST** contain a Header and an Assets element.

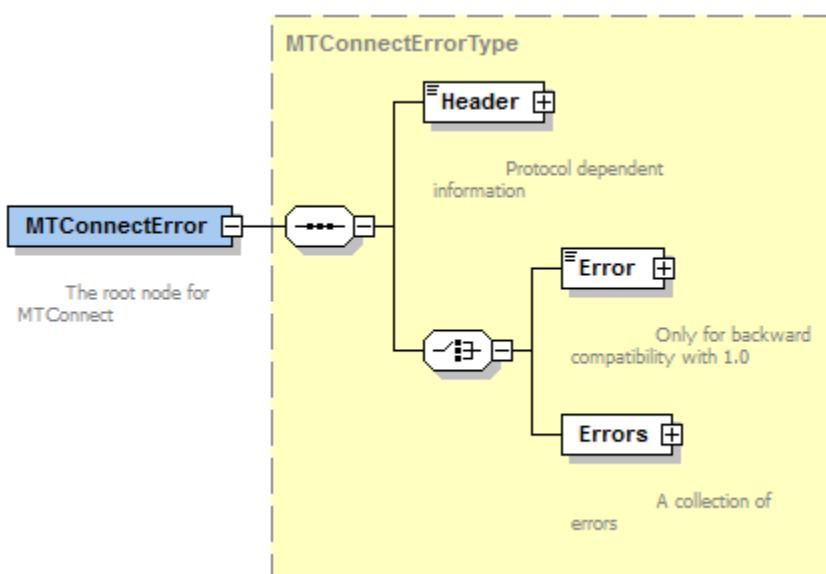

Element	Description	Occurrence
Header	An XML container in an <i>MTConnect Response Document</i> that provides information from an <i>MTConnect Agent</i> defining version information, storage capacity, and parameters associated with the data management within the <i>Agent</i> .	1
Assets	The XML container in an <i>MTConnectAssets Response Document</i> that provides information for <i>MTConnect Assets</i> associated with an <i>MTConnect Agent</i> .	1

1040

1041 **6.3.4 MTConnectError Root Element**

1042 MTConnectError is the *Root Element* for the *MTConnectError Response Document*.

1043

1044

1045 **Figure 9: MTConnectError Structure**

1046

1047 MTConnectError **MUST** contain two *Child Elements* - Header and Errors.

1048 Note: When compatibility with *Version 1.0.1* and earlier of the MTConnect Standard is  
 1049 required for an implementation, the *MTConnectErrors Response Document* contains  
 1050 only a single *Error Data Entity* and the *Errors Child Element* **MUST NOT** appear  
 1051 in the document.

1052

- 1053 Details for Header are defined in *Section 6.5, Document Header*.
- 1054 Errors is an XML container that represents the *Document Body* for an *MTConnectError*  
 1055 *Response Document* – See *Section 6.6*. Details for the semantic data model describing the  
 1056 contents for Errors are defined in *Section 9, Errors Information Model*.
- 1057 MTConnectError also has a number of attributes. These attributes are defined in *Section 6.4,*  
 1058 *Schema and Namespace Declaration*.

#### 1059 **6.3.4.1 MTConnectError Elements**

- 1060 An MTConnectError element **MUST** contain a Header and an Errors element.

Element	Description	Occurrence
Header	An XML container in an <i>MTConnect Response Document</i> that provides information from an <i>MTConnect Agent</i> defining version information, storage capacity, and parameters associated with the data management within the <i>Agent</i> .	1
Errors	The XML container in an <i>MTConnectErrors Response Document</i> that provides information associated with errors encountered by an <i>MTConnect Agent</i> .	1

- 1061
- 1062 **6.4 Schema and Namespace Declaration**
- 1063 XML provides standard methods for declaring the *schema* and *namespace* associated with a document encoded by XML. The declaration of the *schema* and *namespace* for *MTConnect Response Documents* **MUST** be structured as attributes in the *Root Element* of the document. XML defines these attributes as pseudo-attributes since they provide additional information for the entire document and not just specifically for the *Root Element* itself.

1068 Note: If a *Response Document* contains sections that utilize different schemas and/or  
 1069 *namespaces*, additional pseudo-attributes should appear in the document as declared  
 1070 using standard conventions as defined by W3C.

- 1071 For further information on declarations refer to *Appendix C*.

#### 1072 **6.5 Document Header**

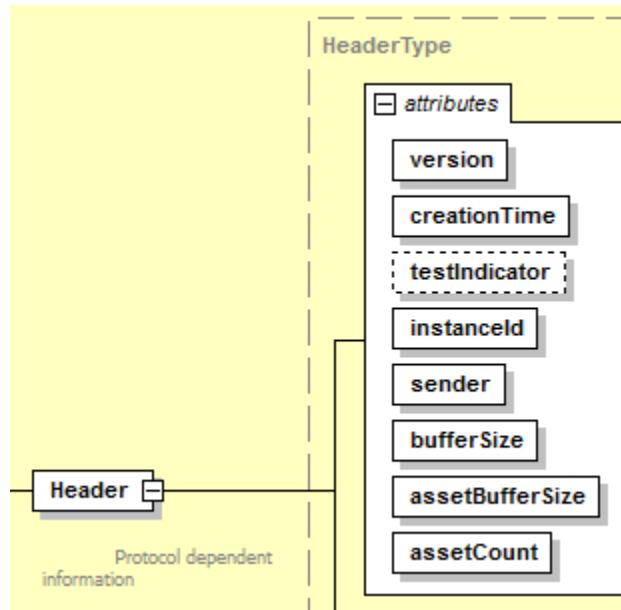

- 1073 The *Document Header* is an XML container in an *MTConnect Response Document* that provides information from an *MTConnect Agent* defining version information, storage capacity, and parameters associated with the data management within the *Agent*. This XML element is called Header.
- 1077 Header **MUST** be the first XML element following the *Root Element* of any *Response Document*. The Header XML element **MUST NOT** contain any *Child Elements*.
- 1079 The content of the Header element will be different for each type of *Response Document*.

1080 **6.5.1 Header for MTConnectDevices**

1081 The `Header` element for an *MTConnectDevices Response Document* defines information  
 1082 regarding the creation of the document and the data storage capability of the *MTConnect Agent*  
 1083 that generated the document.

1084 **6.5.1.1 XML Schema Structure for Header for MTConnectDevices**

1085 The following XML *schema* represents the structure of the `Header` XML element that **MUST**  
 1086 be provided for an *MTConnectDevices Response Document*.

1087

1088 **Figure 10: Header Schema Diagram for MTConnectDevices**

1089

1090

1091 **6.5.1.2 Attributes for Header for MTConnectDevices**

1092 The following table defines the attributes that may be used to provide additional information in  
 1093 the Header element for an *MTConnectDevices Response Document*.

Attribute	Description	Occurrence
version	<p>The <i>major, minor, and revision</i> number of the MTConnect Standard that defines the <i>semantic data model</i> that represents the content of the <i>Response Document</i>. It also includes the revision number of the <i>schema</i> associated with that specific <i>semantic model</i>.</p> <p>The value reported for <b>version</b> <b>MUST</b> be a series of four numeric values, separated by a decimal point, representing a <i>major, minor, and revision</i> number of the MTConnect Standard and the revision number of a specific <i>schema</i>.</p> <p>As an example, the value reported for <b>version</b> for a <i>Response Document</i> that was structured based on <i>schema</i> revision 10 associated with Version 1.4.0 of the MTConnect Standard would be: 1.4.0.10</p> <p><b>version</b> is a required attribute.</p>	1
creationTime	<p><b>creationTime</b> represents the time that an <i>MTConnect Agent</i> published the <i>Response Document</i>.</p> <p><b>creationTime</b> <b>MUST</b> be reported in UTC (Coordinated Universal Time) format; e.g., "2010-04-01T21:22:43Z".</p> <p>Note: Z refers to UTC/GMT time, not local time.</p> <p><b>creationTime</b> is a required attribute.</p>	1
testIndicator	<p>A flag indicating that the <i>MTConnect Agent</i> that published the <i>Response Document</i> is operating in a test mode. The contents of the <i>Response Document</i> may not be valid and <b>SHOULD</b> be used for testing and simulation purposes only.</p> <p>The values reported for <b>testIndicator</b> are:</p> <ul style="list-style-type: none"> <li>- TRUE: The Agent is functioning in a test mode.</li> <li>- FALSE: The Agent is not function in a test mode.</li> </ul> <p>If <b>testIndicator</b> is not specified, the value for <b>testIndicator</b> <b>MUST</b> be interpreted to be FALSE.</p> <p><b>testIndicator</b> is an optional attribute.</p>	0..1

Attribute	Description	Occurrence
instanceId	<p>A number indicating a specific instantiation of the <i>buffer</i> associated with the <i>MTConnect Agent</i> that published the <i>Response Document</i>.</p> <p>The value reported for <code>instanceId</code> <b>MUST</b> be a unique unsigned 64-bit integer.</p> <p>The value for <code>instanceId</code> <b>MUST</b> be changed to a different unique number each time the <i>buffer</i> is cleared and a new set of data begins to be collected.</p> <p><code>instanceId</code> is a required attribute.</p>	1
sender	<p>An identification defining where the <i>MTConnect Agent</i> that published the <i>Response Document</i> is installed or hosted.</p> <p>The value reported for <code>sender</code> <b>MUST</b> be either an IP Address or Hostname describing where the <i>MTConnect Agent</i> is installed or the URL of the <i>MTConnect Agent</i>; e.g., <code>http://&lt;address&gt;[:port]/</code>.</p> <p>Note: The port number need not be specified if it is the default HTTP port 80.</p> <p><code>sender</code> is a required attribute.</p>	1
bufferSize	<p>A value representing the maximum number of <i>Data Entities</i> that <b>MAY</b> be retained in the <i>MTConnect Agent</i> that published the <i>Response Document</i> at any point in time.</p> <p>The value reported for <code>bufferSize</code> <b>MUST</b> be a number representing an unsigned 32-bit integer.</p> <p><code>bufferSize</code> is a required attribute.</p> <p>Note 1: <code>bufferSize</code> represents the maximum number of <i>sequence numbers</i> that <b>MAY</b> be stored in the <i>MTConnect Agent</i>.</p> <p>Note 2: The implementer is responsible for allocating the appropriate amount of storage capacity required to accommodate the <code>bufferSize</code>.</p>	1
assetBufferSize	<p>A value representing the maximum number of <i>Asset Documents</i> that can be stored in the <i>MTConnect Agent</i> that published the <i>Response Document</i>.</p> <p>The value reported for <code>assetBufferSize</code> <b>MUST</b> be a number representing an unsigned 32-bit integer.</p> <p><code>assetBufferSize</code> is a required attribute.</p> <p>Note: The implementer is responsible for allocating the appropriate amount of storage capacity required to accommodate the <code>assetBufferSize</code>.</p>	1

Attribute	Description	Occurrence
assetCount	<p>A number representing the current number of <i>Asset Documents</i> that are currently stored in the <i>MTConnect Agent</i> as of the <i>creationTime</i> that the <i>Agent</i> published the <i>Response Document</i>.</p> <p>The value reported for <code>assetCount</code> <b>MUST</b> be a number representing an unsigned 32-bit integer and <b>MUST NOT</b> be larger than the value reported for <code>assetBufferSize</code>.</p> <p><code>assetCount</code> is a required attribute.</p>	1

1094

1095 The following is an example of a `Header` XML element for an *MTConnectDevices Response Document*:

1097 1. <Header creationTime="2017-02-16T16:44:27Z" sender="MyAgent"  
 1098 2. instanceId="1268463594" bufferSize="131072"  
 1099 3. version="1.4.0.10" assetCount="54" assetBufferSize="1024"/>

1100

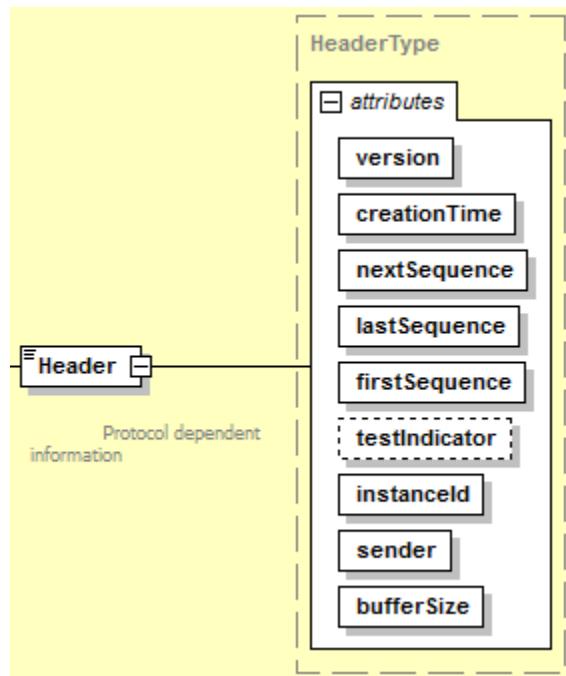

## 1101 **6.5.2 Header for MTConnectStreams**

1102 The `Header` element for an *MTConnectStreams Response Document* defines information  
 1103 regarding the creation of the document and additional information necessary for an application to  
 1104 interact and retrieve data from the *MTConnect Agent*.

1105

1106 **6.5.2.1 XML Schema Structure for Header for MTConnectStreams**

1107 The following XML *schema* represents the structure of the `Header` XML element that **MUST**  
 1108 be provided for an *MTConnectStreams Response Document*.

1109

1110 **Figure 11: Header Schema Diagram for MTConnectStreams**

1111

1112 **6.5.2.2 Attributes for MTConnectStreams Header**

1113 The following table defines the attributes that may be used to provide additional information in  
 1114 the `Header` element for an *MTConnectStreams Response Document*.

Attribute	Description	Occurrence
<code>version</code>	<p>The <i>major, minor, and revision</i> number of the MTConnect Standard that defines the <i>semantic data model</i> that represents the content of the <i>Response Document</i>. It also includes the revision number of the <i>schema</i> associated with that specific <i>semantic model</i>.</p> <p>The value reported for <code>version</code> <b>MUST</b> be a series of four numeric values, separated by a decimal point, representing a <i>major, minor, and revision</i> number of the MTConnect Standard and the revision number of a specific <i>schema</i>.</p> <p>As an example, the value reported for <code>version</code> for a <i>Response Document</i> that was structured based on <i>schema</i> revision 10 associated with Version 1.4.0 of the MTConnect Standard would be: 1.4.0.10</p> <p><code>version</code> is a required attribute.</p>	1

Attribute	Description	Occurrence
creationTime	<p><code>creationTime</code> represents the time that an <i>MTConnect Agent</i> published the <i>Response Document</i>.</p> <p><code>creationTime</code> <b>MUST</b> be reported in UTC (Coordinated Universal Time) format; e.g., "2010-04-01T21:22:43Z".</p> <p>Note: Z refers to UTC/GMT time, not local time.</p> <p><code>creationTime</code> is a required attribute.</p>	1
nextSequence	<p>A number representing the <i>sequence number</i> of the piece of <i>Streaming Data</i> that is the next piece of data to be retrieved from the <i>buffer</i> of the <i>MTConnect Agent</i> that was not included in the <i>Response Document</i> published by the <i>Agent</i>.</p> <p>If the <i>Streaming Data</i> included in the <i>Response Document</i> includes the last piece of data stored in the <i>buffer</i> of the <i>MTConnect Agent</i> at the time that the document was published, then the value reported for <code>nextSequence</code> <b>MUST</b> be equal to <code>lastSequence + 1</code>.</p> <p>The value reported for <code>nextSequence</code> <b>MUST</b> be a number representing an unsigned 64-bit integer.</p> <p><code>nextSequence</code> is a required attribute.</p>	1
lastSequence	<p>A number representing the <i>sequence number</i> assigned to the last piece of <i>Streaming Data</i> that was added to the <i>buffer</i> of the <i>MTConnect Agent</i> immediately prior to the time that the <i>Agent</i> published the <i>Response Document</i>.</p> <p>The value reported for <code>lastSequence</code> <b>MUST</b> be a number representing an unsigned 64-bit integer.</p> <p><code>lastSequence</code> is a required attribute.</p>	1
firstSequence	<p>A number representing the <i>sequence number</i> assigned to the oldest piece of <i>Streaming Data</i> stored in the <i>buffer</i> of the <i>MTConnect Agent</i> immediately prior to the time that the <i>Agent</i> published the <i>Response Document</i>.</p> <p>The value reported for <code>firstSequence</code> <b>MUST</b> be a number representing an unsigned 64-bit integer.</p> <p><code>firstSequence</code> is a required attribute.</p>	1

Attribute	Description	Occurrence
testIndicator	<p>A flag indicating that the <i>MTConnect Agent</i> that published the <i>Response Document</i> is operating in a test mode. The contents of the <i>Response Document</i> may not be valid and <b>SHOULD</b> be used for testing and simulation purposes only.</p> <p>The values reported for <code>testIndicator</code> are:</p> <ul style="list-style-type: none"> <li>- TRUE: The <i>Agent</i> is functioning in a test mode.</li> <li>- FALSE: The <i>Agent</i> is not functioning in a test mode.</li> </ul> <p>If <code>testIndicator</code> is not specified, the value for <code>testIndicator</code> <b>MUST</b> be interpreted to be FALSE.</p> <p><code>testIndicator</code> is an optional attribute.</p>	0..1
instanceId	<p>A number indicating a specific instantiation of the <i>buffer</i> associated with the <i>MTConnect Agent</i> that published the <i>Response Document</i>.</p> <p>The value reported for <code>instanceId</code> <b>MUST</b> be a unique unsigned 64-bit integer.</p> <p>The value for <code>instanceId</code> <b>MUST</b> be changed to a different unique number each time the <i>buffer</i> is cleared and a new set of data begins to be collected.</p> <p><code>instanceId</code> is a required attribute.</p>	1
sender	<p>An identification defining where the <i>MTConnect Agent</i> that published the <i>Response Document</i> is installed or hosted.</p> <p>The value reported for <code>sender</code> <b>MUST</b> be either an IP Address or Hostname describing where the <i>MTConnect Agent</i> is installed or the URL of the <i>MTConnect Agent</i>; e.g., <code>http://&lt;address&gt;[:port]/</code>.</p> <p>Note: The port number need not be specified if it is the default HTTP port 80.</p> <p><code>sender</code> is a required attribute.</p>	1
bufferSize	<p>A value representing the maximum number of <i>Data Entities</i> that <b>MAY</b> be retained in the <i>MTConnect Agent</i> that published the <i>Response Document</i> at any point in time.</p> <p>The value reported for <code>bufferSize</code> <b>MUST</b> be a number representing an unsigned 32-bit integer.</p> <p><code>bufferSize</code> is a required attribute.</p> <p>Note 1: <code>bufferSize</code> represents the maximum number of <i>sequence numbers</i> that <b>MAY</b> be stored in the <i>MTConnect Agent</i>.</p> <p>Note 2: The implementer is responsible for allocating the appropriate amount of storage capacity required to accommodate the <code>bufferSize</code>.</p>	1

1116 The following is an example of a Header XML element for an *MTConnectStreams Response*  
 1117 *Document*:

```
1118 1. <Header creationTime="2017-02-16T16:44:27Z" sender="MyAgent"
1119 2.     instanceId="1268463594" bufferSize="131072"
1120 3.     version="1.4.0.10" assetCount="54" assetBufferSize="1024"/>
```

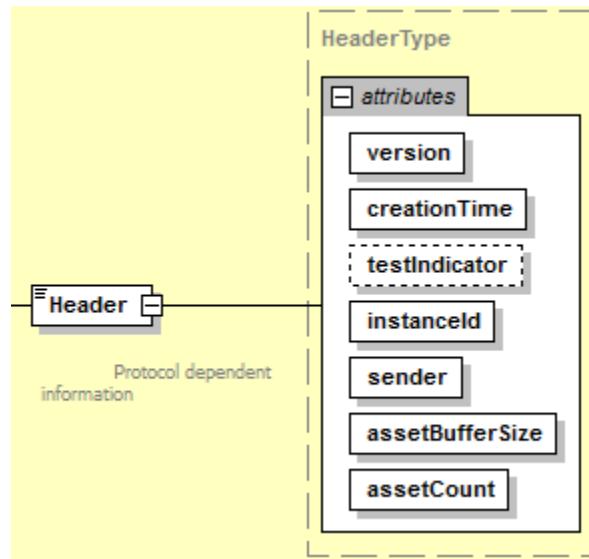

1121

### 1122 **6.5.3 Header for MTConnectAssets**

1123 The Header element for an *MTConnectAssets Response Document* defines information  
 1124 regarding the creation of the document and the storage of *Asset Documents* in the *MTConnect*  
 1125 *Agent* that generated the document.

#### 1126 **6.5.3.1 XML Schema Structure for Header for MTConnectAssets**

1127 The following XML *schema* represents the structure of the Header XML element that **MUST**  
 1128 be provided for an *MTConnectAssets Response Document*.

1129

1130 **Figure 12: Header Schema Diagram for MTConnectAssets**

1131

1132

1133 **6.5.3.2 Attributes for Header for MTConnectAssets**

1134 The following table defines the attributes that may be used to provide additional information in  
 1135 the Header element for an *MTConnectAssets Response Document*.

1136

Attribute	Description	Occurrence
version	<p>The <i>major, minor, and revision</i> number of the MTConnect Standard that defines the <i>semantic data model</i> that represents the content of the <i>Response Document</i>. It also includes the revision number of the <i>schema</i> associated with that specific <i>semantic model</i>.</p> <p>The value reported for <b>version</b> <b>MUST</b> be a series of four numeric values, separated by a decimal point, representing a <i>major, minor, and revision</i> number of the MTConnect Standard and the revision number of a specific <i>schema</i>.</p> <p>As an example, the value reported for <b>version</b> for a <i>Response Document</i> that was structured based on <i>schema</i> revision 10 associated with Version 1.4.0 of the MTConnect Standard would be: 1.4.0.10</p> <p><b>version</b> is a required attribute.</p>	1
creationTime	<p><b>creationTime</b> represents the time that an <i>MTConnect Agent</i> published the <i>Response Document</i>.</p> <p><b>creationTime</b> <b>MUST</b> be reported in UTC (Coordinated Universal Time) format; e.g., "2010-04-01T21:22:43Z".</p> <p>Note: Z refers to UTC/GMT time, not local time.</p> <p><b>creationTime</b> is a required attribute.</p>	1
testIndicator	<p>A flag indicating that the <i>MTConnect Agent</i> that published the <i>Response Document</i> is operating in a test mode. The contents of the <i>Response Document</i> may not be valid and <b>SHOULD</b> be used for testing and simulation purposes only.</p> <p>The values reported for <b>testIndicator</b> are:</p> <ul style="list-style-type: none"> <li>- TRUE: The <i>Agent</i> is functioning in a test mode.</li> <li>- FALSE: The <i>Agent</i> is not functioning in a test mode.</li> </ul> <p>If <b>testIndicator</b> is not specified, the value for <b>testIndicator</b> <b>MUST</b> be interpreted to be FALSE.</p> <p><b>testIndicator</b> is an optional attribute.</p>	0..1

Attribute	Description	Occurrence
instanceId	<p>A number indicating a specific instantiation of the <i>buffer</i> associated with the <i>MTConnect Agent</i> that published the <i>Response Document</i>.</p> <p>The value reported for <code>instanceId</code> <b>MUST</b> be a unique unsigned 64-bit integer.</p> <p>The value for <code>instanceId</code> <b>MUST</b> be changed to a different unique number each time the <i>buffer</i> is cleared and a new set of data begins to be collected.</p> <p><code>instanceId</code> is a required attribute.</p>	1
sender	<p>An identification defining where the <i>MTConnect Agent</i> that published the <i>Response Document</i> is installed or hosted.</p> <p>The value reported for <code>sender</code> <b>MUST</b> be either an IP Address or Hostname describing where the <i>MTConnect Agent</i> is installed or the URL of the <i>MTConnect Agent</i>; e.g., <code>http://&lt;address&gt;[:port]/</code>.</p> <p>Note: The port number need not be specified if it is the default HTTP port 80.</p> <p><code>sender</code> is a required attribute.</p>	1
assetBufferSize	<p>A value representing the maximum number of <i>Asset Documents</i> that <b>MAY</b> be retained in the <i>MTConnect Agent</i> that published the <i>Response Document</i> at any point in time.</p> <p>The value reported for <code>bufferSize</code> <b>MUST</b> be a number representing an unsigned 32-bit integer.</p> <p><code>bufferSize</code> is a required attribute.</p> <p>Note 1: <code>bufferSize</code> represents the maximum number of <i>sequence numbers</i> that <b>MAY</b> be stored in the <i>MTConnect Agent</i>.</p> <p>Note 2: The implementer is responsible for allocating the appropriate amount of storage capacity required to accommodate the <code>bufferSize</code>.</p>	1
assetCount	<p>A number representing the current number of <i>Asset Documents</i> that are currently stored in the <i>MTConnect Agent</i> as of the <code>creationTime</code> that the <i>Agent</i> published the <i>Response Document</i>.</p> <p>The value reported for <code>assetCount</code> <b>MUST</b> be a number representing an unsigned 32-bit integer and <b>MUST NOT</b> be larger than the value reported for <code>assetBufferSize</code>.</p> <p><code>assetCount</code> is a required attribute.</p>	1

1139 The following is an example of a Header XML element for an *MTConnectAssets Response Document*:

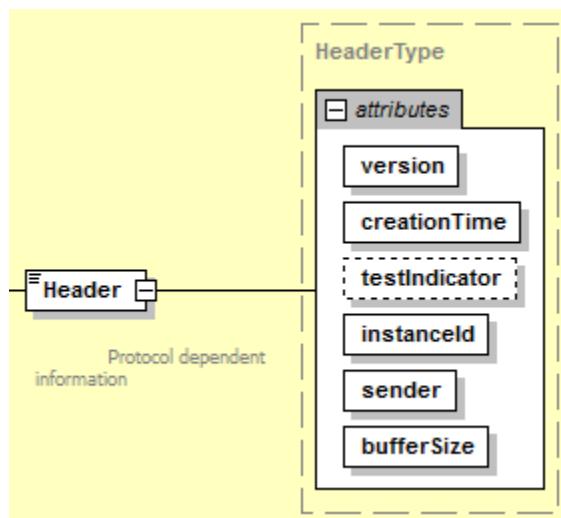

```
1141 1. <Header creationTime="2017-02-16T16:44:27Z" sender="MyAgent"
1142     2.     instanceId="1268463594" version="1.4.0.10" assetCount="54"
1143     3.     assetBufferSize="1024"/>
```

#### 1144 **6.5.4 Header for MTConnectError**

1145 The Header element for an *MTConnectError Response Document* defines information  
 1146 regarding the creation of the document and the data storage capability of the *MTConnect Agent*  
 1147 that generated the document.

##### 1148 **6.5.4.1 XML Schema Structure for Header for MTConnectError**

1149 The following XML schema represents the structure of the Header XML element that **MUST**  
 1150 be provided for an *MTConnectError Response Document*.

1151

1152 **Figure 13: Header Schema Diagram for MTConnectError**

1153

1154

1155 **6.5.4.2 Attributes for Header for MTConnectError**

1156 The following table defines the attributes that may be used to provide additional information in  
 1157 the Header element for an *MTConnectError Response Document*.

Attribute	Description	Occurrence
version	<p>The <i>major, minor, and revision</i> number of the MTConnect Standard that defines the <i>semantic data model</i> that represents the content of the <i>Response Document</i>. It also includes the revision number of the <i>schema</i> associated with that specific <i>semantic model</i>.</p> <p>The value reported for <b>version</b> <b>MUST</b> be a series of four numeric values, separated by a decimal point, representing a <i>major, minor, and revision</i> number of the MTConnect Standard and the revision number of a specific <i>schema</i>.</p> <p>As an example, the value reported for <b>version</b> for a <i>Response Document</i> that was structured based on <i>schema</i> revision 10 associated with Version 1.4.0 of the MTConnect Standard would be: 1.4.0.10</p> <p><b>version</b> is a required attribute.</p>	1
creationTime	<p><b>creationTime</b> represents the time that an <i>MTConnect Agent</i> published the <i>Response Document</i>.</p> <p><b>creationTime</b> <b>MUST</b> be reported in UTC (Coordinated Universal Time) format; e.g., "2010-04-01T21:22:43Z".</p> <p>Note: Z refers to UTC/GMT time, not local time.</p> <p><b>creationTime</b> is a required attribute.</p>	1
testIndicator	<p>A flag indicating that the <i>MTConnect Agent</i> that published the <i>Response Document</i> is operating in a test mode. The contents of the <i>Response Document</i> may not be valid and <b>SHOULD</b> be used for testing and simulation purposes only.</p> <p>The values reported for <b>testIndicator</b> are:</p> <ul style="list-style-type: none"> <li>- <b>TRUE</b>: The <i>Agent</i> is functioning in a test mode.</li> <li>- <b>FALSE</b>: The <i>Agent</i> is not functioning in a test mode.</li> </ul> <p>If <b>testIndicator</b> is not specified, the value for <b>testIndicator</b> <b>MUST</b> be interpreted to be <b>FALSE</b>.</p> <p><b>testIndicator</b> is an optional attribute.</p>	0..1

instanceId	<p>A number indicating a specific instantiation of the <i>buffer</i> associated with the <i>MTConnect Agent</i> that published the <i>Response Document</i>.</p> <p>The value reported for <code>instanceId</code> <b>MUST</b> be a unique unsigned 64-bit integer.</p> <p>The value for <code>instanceId</code> <b>MUST</b> be changed to a different unique number each time the <i>buffer</i> is cleared and a new set of data begins to be collected.</p> <p><code>instanceId</code> is a required attribute.</p>	1
sender	<p>An identification defining where the <i>MTConnect Agent</i> that published the <i>Response Document</i> is installed or hosted.</p> <p>The value reported for <code>sender</code> <b>MUST</b> be either an IP Address or Hostname describing where the <i>MTConnect Agent</i> is installed or the URL of the <i>MTConnect Agent</i>; e.g., <code>http://&lt;address&gt;[:port]/</code>.</p> <p>Note: The port number need not be specified if it is the default HTTP port 80.</p> <p><code>sender</code> is a required attribute.</p>	1
bufferSize	<p>A value representing the maximum number of <i>Data Entities</i> that <b>MAY</b> be retained in the <i>MTConnect Agent</i> that published the <i>Response Document</i> at any point in time.</p> <p>The value reported for <code>bufferSize</code> <b>MUST</b> be a number representing an unsigned 32-bit integer.</p> <p><code>bufferSize</code> is a required attribute.</p> <p>Note 1: <code>bufferSize</code> represents the maximum number of <i>sequence numbers</i> that <b>MAY</b> be stored in the <i>MTConnect Agent</i>.</p> <p>Note 2: The implementer is responsible for allocating the appropriate amount of storage capacity required to accommodate the <code>bufferSize</code>.</p>	1

1158

1159 The following is an example of a `Header` XML element for an *MTConnectError Response Document*:

1161 1. <Header creationTime="2017-02-16T16:44:27Z" sender="MyAgent"  
 1162 2. instanceId="1268463594" bufferSize="131072" version="1.4.0.10"/>

1163

1164 **6.6 Document Body**

1165 The *Document Body* contains the information that is published by an *MTConnect Agent* in  
 1166 response to a *Request* from a client software application. Each *Response Document* has a  
 1167 different XML element that represents the *Document Body*.

1168 The structure of the content of the XML element representing the *Document Body* is defined by  
 1169 the *semantic data models* defined for each *Response Document*.

1170 The following table defines the relationship between each of the *Response Documents*, the XML  
 1171 element that represents the *Document Body* for each document, and the *semantic data model* that  
 1172 defines the structure for the content of each of the *Response Documents*:

<b>Response Document</b>	<b>XML Element for Document Body</b>	<b>Semantic Data Model</b>
<i>MTConnectDevices</i>	Devices	<i>Devices Information Model</i> , MTConnect Standard – Part 2.0
<i>MTConnectStreams</i>	Streams	<i>Streams Information Model</i> , MTConnect Standard – Part 3.0
<i>MTConnectAssets</i>	Assets	<i>Assets Information Model</i> , MTConnect Standard – Part 4.0, and its sub- <i>Parts</i>
<i>MTConnectError</i>	Errors  Note: Errors <b>MUST NOT</b> be used when backwards compatibility with MTConnect Standard Version 1.0.1 and earlier is required.	<i>Errors Information Model</i> , MTConnect Standard – Part 1.0, Section 9

1173

1174

1175    **6.7 Extensibility**

1176    MTConnect is an extensible standard, which means that implementers **MAY** extend the *Data*  
1177    *Models* defined in the various sections of the MTConnect Standard to include information  
1178    required for a specific implementation. When these *Data Models* are encoded using XML, the  
1179    methods for extending these *Data Models* are defined by the rules established for extending any  
1180    XML schema (see the W3C website for more details on extending XML data models).

1181    The following are typical extensions that **MAY** be considered in the MTConnect *Data Models*:

- 1182    • Additional *type* and *subType* values for *Data Entities*.
- 1183    • Additional *Structural Elements* as containers.
- 1184    • Additional *Composition* elements.
- 1185    • New *Asset* types that are sub-typed from the *Abstract Asset* type.
- 1186    • *Child Elements* that may be added to specific XML elements contained within the  
1187    *MTConnect Information Models*. These extended elements **MUST** be identified in a  
1188    separate *namespace*.

1189    When extending an MTConnect *Data Model*, there are some basic rules restricting changes to  
1190    the MTConnect *Data Models*.

1191    When extending an *MTConnect Data Model*, an implementer:

- 1192    • **MUST NOT** add new value for *category* for *Data Entities*,
- 1193    • **MUST NOT** add new *Root Elements*,
- 1194    • **SHOULD NOT** add new *Top Level Components*, and
- 1195    • **MUST NOT** add any new attributes or include any sub-elements to *Composition*.

1196       Note: Throughout the documents additional information is provided where extensibility  
1197       may be acceptable or unacceptable to maintain compliance with the MTConnect  
1198       Standard.

1199    When a *schema* representing a *Data Model* is extended, the *Schema and Namespace Declaration*  
1200    at the beginning of the corresponding *Response Document* **MUST** be updated to reflect the new  
1201    *schema* and *namespace* so that a client software application can properly validate the *Response*  
1202    *Document*.

1203

1204 An XML example of a *Schema and Namespace Declaration*, including an extended *schema* and  
 1205 *namespace*, would be:

```
1206 1.  <?xml version="1.0" encoding="UTF-8"?>
1207 2.    <MTConnectDevices
1208 3.      xmlns:xsi=http://www.w3.org/2001/XMLSchema-instance
1209 4.      xmlns="urn:mtconnect.org:MTConnectDevices:1.3"
1210 5.      xmlns:m="urn:mtconnect.org:MTConnectDevices:1.3"
1211 6.      xmlns:x="urn:MyLocation:MyFile:MyVersion"
1212 7.      xsi:schemaLocation="urn:MyLocation:MyFile:MyVersion
1213           /schemas/MyFileName.xsd">
```

1214 In this example:

- `xmlns:x` is added in Line 6 to identify the *XML Schema Instance* for the extended *schema*. *Element Names* identified with an “`x`” prefix are associated with this specific *XML Schema Instance*.

1218 Note: The “`x`” prefix **MAY** be replaced with any prefix that the implementer chooses for  
 1219 identifying the extended *schema* and *namespace*.

- `xsi:schemaLocation` is modified in Line 7 to associate the namespace URN with the URL specifying the location of schema file.
- *MyLocation, MyFile, MyVersion, and MyFileName* in Lines 6 and 7 **MUST** be replaced by the actual name, version, and location of the extended *schema*.

1224 When an extended *schema* is implemented, each *Structural Element, Data Entity, and MTConnect Asset* defined in the extended *schema* **MUST** be identified in each respective *Response Document* by adding a prefix to the XML *Element Name* associated with that *Structural Element, Data Entity, or MTConnect Asset*. The prefix identifies the *schema* and *namespace* where that XML Element is defined.

## 1229 7 Protocol and Messaging

1230 An *MTConnect® Agent* performs two major communications tasks. It collects information from  
 1231 pieces of equipment and it publishes *MTConnect Response Documents* in response to *Requests*  
 1232 from client software applications.

1233 The MTConnect Standard does not address the method used by an *MTConnect Agent* to collect  
 1234 information from a piece of equipment. The relationship between the *Agent* and a piece of  
 1235 equipment is implementation dependent. The *Agent* may be fully integrated into the piece of  
 1236 equipment or the *Agent* may be independent of the piece of equipment. Implementation of the  
 1237 relationship between a piece of equipment and an *MTConnect Agent* is the responsibility of the  
 1238 supplier of the piece of equipment and/or the implementer of the *MTConnect Agent*.

1239 The communications mechanism between an *MTConnect Agent* and a client software application  
 1240 requires the following primary components:

- 1241 • *Physical Connection*: The network transmission technologies that physically  
 1242 interconnect an *MTConnect Agent* and a client software application. Examples of a  
 1243 *Physical Connection* would be an Ethernet network or a wireless connection.
- 1244 • *Transport Protocol*: A set of capabilities that provide the rules and procedures used to  
 1245 transport information between an *MTConnect Agent* and a client software application  
 1246 through a *Physical Connection*.
- 1247 • *Application Programming Interface (API)*: The *Request* and *Response* interactions that  
 1248 occur between an *MTConnect Agent* and a client software application.
- 1249 • *Message*: The content of the information that is exchanged. The *Message* includes both  
 1250 the content of the *MTConnect Response Document* and any additional information  
 1251 required for the client software application to interpret the *Response Document*.

1252 Note: The *Physical Connections*, *Transport Protocols*, and *Application Programming*  
 1253 *Interface (API)* supported by an *MTConnect Agent* are independent of the *Message*  
 1254 itself; i.e., the information contained in the *MTConnect Response Documents* is not  
 1255 changed based on the methods used to transport those documents to a client  
 1256 software application.

1257 An *MTConnect Agent* **MAY** support multiple methods for communicating with client software  
 1258 applications. The MTConnect Standard specifies one methodology for communicating that  
 1259 **MUST** be supported by every *MTConnect Agent*. This methodology is a *REpresentational State*  
 1260 *Transfer* (REST) interface, which defines a stateless, client-server communications architecture.  
 1261 This REST interface is the architectural pattern that specifies the exchange of information  
 1262 between an *MTConnect Agent* and a client software application. REST dictates that a server has  
 1263 no responsibility for tracking or coordinating with a client software application regarding which  
 1264 information or how much information the client software application may request from a server.  
 1265 This removes the burden for a server to keep track of client sessions. An *MTConnect Agent*  
 1266 **MUST** be implemented as a server supporting the RESTful interface.

## 1267 8 *HTTP Messaging Supported by an MTConnect Agent*

1268 This section describes the application of *HTTP Messaging* applied to a REST interface that  
 1269 **MUST** be supported by an *MTConnect Agent* to realize the *MTConnect Request/Response*  
 1270 *Information Exchange* functionality

### 1271 8.1 REST Interface

1272 An *MTConnect Agent* **MUST** provide a REST interface that supports HTTP version 1.0 to  
 1273 communicate with client applications. This interface **MUST** support HTTP (RFC7230) and use  
 1274 URIs (RFC3986) to identify specific information requested from an *Agent*. HTTP is most often  
 1275 implemented on top of the Transmission Control Protocol (TCP) that provides an ordered byte  
 1276 stream of data and the Internet Protocol (IP) that provides unified addressing and routing  
 1277 between computers. However, additional interfaces to an *MTConnect Agent* may be  
 1278 implemented in conjunction with any other communications technologies.

1279 The REST interface supports an *Application Programming Interface (API)* that adheres to the  
 1280 architectural principles of a stateless, uniform interface to retrieve data and other information  
 1281 related to either pieces of equipment or *MTConnect Assets*. The API allows for access, but not  
 1282 modification of data stored within the *MTConnect Agent* and is nullipotent, meaning it will not  
 1283 produce any side effects on the information stored in an *MTConnect Agent* or the function of the  
 1284 *Agent* itself.

1285 *HTTP Messaging* is comprised of two basic functions – an *HTTP Request* and an *HTTP*  
 1286 *Response*. A client software application forms a *Request* for information from an *MTConnect*  
 1287 *Agent* by specifying a specific set of information using an *HTTP Request*. In response, an  
 1288 *MTConnect Agent* provides either an *HTTP Response* or replies with an *HTTP Error Message* as  
 1289 defined below.

### 1290 8.2 *HTTP Request*

1291 The MTConnect Standard defines that an *MTConnect Agent* **MUST** support the HTTP GET verb  
 1292 – no other HTTP methods are required to be supported.

1293 An *HTTP Request* **MAY** include three sections:

- 1294     • an *HTTP Request Line*
- 1295     • *HTTP Header Fields*
- 1296     • an *HTTP Body*

1298 The MTConnect Standard defines that an *HTTP Request* issued by a client application  
1299 **SHOULD** only have two sections:

- 1300 • an *HTTP Request Line*

- 1301 • *Header Fields*.

1302 The *HTTP Request Line* identifies the specific information being requested by the client software  
1303 application. If an *MTConnect Agent* receives any information in an *HTTP Request* that is not  
1304 specified in the MTConnect Standard, the *Agent* **MAY** ignore it.

1305 The structure of an *HTTP Request Line* consists of the following portions:

- 1306 • *HTTP Request Method*: GET
- 1307 • *HTTP Request URL*: http://<authority>/<path>[?<query>]
- 1308 • *HTTP Version*: HTTP/1.0

1309 For the following discussion, the *HTTP Request URL* will only be considered since the *Method*  
1310 will always be GET and the MTConnect Standard only requires HTTP/1.0.

### 1311 **8.2.1 authority Portion of an *HTTP Request Line***

1312 The *authority* portion consists of the DNS name or IP address associated with an *MTConnect*  
1313 *Agent* and an optional TCP port number [ :*port* ] that the *Agent* is listening to for incoming  
1314 *Requests* from client software applications. If the port number is the default Port 80, *Port* is not  
1315 required.

1316 Example forms for *authority* are:

- 1317 • http://machine/
- 1318 • http://machine:5000/
- 1319 • http://192.168.1.2:5000/

1320

1321 **8.2.2 path Portion of an *HTTP Request Line***

1322 The <Path> portion of the *HTTP Request Line* has the follow segments:

- 1323 • /<name or uuid>/<request>

1324 In this portion of the *HTTP Request Line*, name or uuid designates that the information to be  
 1325 returned in a *Response Document* is associated with a specific piece of equipment that has  
 1326 published data to the *MTConnect Agent*. See *Part 2 - Devices Information Model* for details on  
 1327 name or uuid for a piece of equipment.

1328 Note: If name or uuid are not specified in the *HTTP Request Line*, an *MTConnect*  
 1329 **Agent** **MUST** return the information for all pieces of equipment that have published  
 1330 data to the *Agent* in the *Response Document*.

1331 In the <Path> portion of the *HTTP Request Line*, <request> designates one of the *Requests*  
 1332 defined in *Section 5.4*. The value for <request> **MUST** be *probe*, *current*, *sample*, or  
 1333 *asset* (*s*) representing the *Probe Request*, *Current Request*, *Sample Request*, and *Asset*  
 1334 *Request* respectively.

1335 **8.2.3 query Portion of an *HTTP Request Line***

1336 The [ ?<query>] portion of the *HTTP Request Line* designates an *HTTP Query*. *Query* is a  
 1337 string of parameters that define filters used to refine the content of a *Response Document*  
 1338 published in response to an *HTTP Request*.

1339 **8.3 MTConnect Request/Response Information Exchange Implemented with**  
 1340 **HTTP**

1341 An *MTConnect Agent* **MUST** support *Probe Requests*, *Current Requests*, *Sample Requests*, and  
 1342 *Asset Requests*.

1343 The following sections define how the *HTTP Request Line* is structured to support each of these  
 1344 types of *Requests* and the information that an *MTConnect Agent* **MUST** provide in response to  
 1345 these *Requests*.

1346 **8.3.1 Probe Request Implemented Using HTTP**

1347 An *MTConnect Agent* responds to a *Probe Request* with an *MTConnectDevices Response*  
 1348 *Document* that contains the *Equipment Metadata* for pieces of equipment that are requested and  
 1349 currently represented in the *Agent*.

1350

1351 There are two forms of the *Probe Request*:

- 1352 • The first form includes an *HTTP Request Line* that does not specify a specific path portion (name or uuid). In response to this *Request*, the *MTConnect Agent* returns an *MTConnectDevices Response Document* with information for all pieces of equipment represented in the *MTConnect Agent*.
  - 1356 1. `http://<authority>/probe`
- 1357 • The second form includes an *HTTP Request Line* that specifies a specific path portion that defines either a name or uuid. In response to this *Request*, the *MTConnect Agent* returns an *MTConnectDevices Response Document* with information for only the one piece of equipment associated with that name or uuid.
  - 1361 1. `http://<authority>/<name or uuid>/probe`

### 1362 **8.3.1.1 Path Portion of the HTTP Request Line for a Probe Request**

1363 The following segments of path **MUST** be supported in an *HTTP Request Line* for a *Probe Request*:

Path Segments	Description
name or UUID	If present, specifies that only the <i>Equipment Metadata</i> for the piece of equipment <i>represented by</i> the name or UUID will be published  If not present, <i>Metadata</i> for all pieces of equipment associated with the <i>MTConnect Agent</i> will be published.
<request>	Designates one of the following <i>Requests</i> : probe, current, sample, or asset(s).  probe <b>MUST</b> be provided.

1365

### 1366 **8.3.1.2 Query Portion of the HTTP Request Line for a Probe Request**

1367 The *HTTP Request Line* for a *Probe Request* **SHOULD NOT** contain a *Query*. If the *Request* does contain a *Query*, the *Agent* **MUST** ignore the *Query*.

### 1369 **8.3.1.3 Response to a Probe Request**

1370 The *Response* to a *Probe Request* **SHOULD** be an *MTConnectDevices Response Document* for one or more pieces of equipment as designated by the path portion of the *Request*.

1372 The *Response Document* returned in response to a *Probe Request* **MUST** always provide the most recent information available to an *MTConnect Agent*.

1374 The *Response* **MUST** also include an *HTTP Status Code*. If problems are encountered by an *MTConnect Agent* while responding to a *Probe Request*, the *Agent* **MUST** also publish an *Error Response Document*.

1377 **8.3.1.4 HTTP Status Codes for a Probe Request**

1378 The following *HTTP Status Codes* **MUST** be supported as possible responses to a *Probe*  
 1379 *Request*:

HTTP Status Code	Code Name	Description
200	OK	The <i>Request</i> was handled successfully.
400	Bad Request	The <i>Request</i> could not be interpreted.  The <i>MTConnect Agent</i> <b>MUST</b> return a 400 <i>HTTP Response Code</i> . Also, the <i>Agent</i> <b>MUST</b> publish an <i>Error Response Document</i> that identifies either <code>INVALID_URI</code> or <code>INVALID_REQUEST</code> as the <code>errorCode</code> .
404	Not Found	The <i>Request</i> could not be interpreted.  The <i>MTConnect Agent</i> <b>MUST</b> return a 404 <i>HTTP Response Code</i> . Also, the <i>Agent</i> <b>MUST</b> publish an <i>Error Response Document</i> that identifies <code>NO_DEVICE</code> as the <code>errorCode</code> .
405	Method Not Allowed	A method other than GET was specified in the <i>Request</i> or the piece of equipment specified in the <i>Request</i> could not be found.  The <i>MTConnect Agent</i> <b>MUST</b> return a 405 <i>HTTP Response Code</i> . Also, the <i>Agent</i> <b>MUST</b> publish an <i>Error Response Document</i> that identifies <code>UNSUPPORTED</code> as the <code>errorCode</code> .
406	Not Acceptable	The <i>HTTP Accept Header</i> in the <i>Request</i> was not one of the supported representations.  The <i>MTConnect Agent</i> <b>MUST</b> return a 406 <i>HTTP Response Code</i> . Also, the <i>Agent</i> <b>MUST</b> publish an <i>Error Response Document</i> that identifies <code>UNSUPPORTED</code> as the <code>errorCode</code> .
431	Request Header Fields Too Large	The fields in the <i>HTTP Request</i> exceed the limit of the implementation of the <i>MTConnect Agent</i> .  The <i>MTConnect Agent</i> <b>MUST</b> return a 431 <i>HTTP Response Code</i> . Also, the <i>Agent</i> <b>MUST</b> publish an <i>Error Response Document</i> that identifies <code>INVALID_REQUEST</code> as the <code>errorCode</code> .
500	Internal Server Error	There was an unexpected error in the <i>MTConnect Agent</i> while responding to a <i>Request</i> .  The <i>MTConnect Agent</i> <b>MUST</b> return a 500 <i>HTTP Response Code</i> . Also, the <i>Agent</i> <b>MUST</b> publish an <i>Error Response Document</i> that identifies <code>INTERNAL_ERROR</code> as the <code>errorCode</code> .

1380

1381 **8.3.2 Current Request Implemented Using HTTP**

1382 An *MTConnect Agent* responds to a *Current Request* with an *MTConnectStreams Response Document* that contains the current value of *Data Entities* associated with each piece of *Streaming Data* available from the *Agent*, subject to any filtering defined in the *Request*.

1385 There are two forms of the *Current Request*:

- 1386 • The first form is given without a specific path portion (name or uuid). In response to  
1387 this *Request*, the *MTConnect Agent* returns an *MTConnectStreams Response Document*  
1388 with information for all pieces of equipment represented in the *buffer* of the *Agent*.

1389 1. `http://<authority>/current[?query]`

- 1390 • The second form includes a specific path portion that defines either a name or uuid. In  
1391 response to this *Request*, the *MTConnect Agent* returns an *MTConnectStreams Response Document*  
1392 with information for only the one piece of equipment associated with the  
1393 name or uuid defined in the *Request*.

1394 1. `http://<authority>/<name or uuid>/current[?query]`

1395 **8.3.2.1 Path Portion of the HTTP Request Line for a Current Request**

1396 The following segments of path **MUST** be supported for an *HTTP Request Line* for a *Current Request*:

Path Segments	Description
name or UUID	If present, specifies that only the <i>Data Entities</i> for the piece of equipment represented by the name or UUID will be published.  If not present, <i>Data Entities</i> for all pieces of equipment associated with the <i>Agent</i> will be published.
<request>	Designates one of the following <i>Requests</i> : probe, current, sample, or asset(s).  current <b>MUST</b> be provided.

1398

1399 **8.3.2.2 Query Portion of the HTTP Request Line for a Current Request**

1400 A *Query* may be used to more precisely define the specific information to be included in a  
1401 *Response Document*. Multiple parameters may be used in a *Query* to further refine the  
1402 information to be included. When multiple parameters are provided, each parameter is  
1403 separated by an ampersand (&) character and each parameter appears only once in the *Query*.  
1404 The parameters within the *Query* may appear in any sequence.

1405

1406 The following `query` parameters **MUST** be supported in an *HTTP Request Line* for a *Current*  
 1407 *Request*:

Query Parameters	Description
path	<p>An XPATH that defines specific information or a set of information to be included in an <i>MTConnectStreams Response Document</i>.</p> <p>The value for the XPATH is the location of the information defined in the <i>MTConnectDevices Information Model</i> that represents the <i>Structural Element(s)</i> and/or the specific <i>Data Entities</i> to be included in the <i>MTConnectStreams Response Document</i>.</p>
at	<p>Requests that the <i>MTConnect Response Document</i> <b>MUST</b> include the current value for all <i>Data Entities</i> relative to the time that a specific <i>sequence number</i> was recorded.</p> <p>The value associated with the <code>at</code> parameter references a specific <i>sequence number</i>. The value <b>MUST</b> be an unsigned 64-bit value.</p> <p>The <code>at</code> parameter <b>MUST NOT</b> be used in conjunction with the <code>interval</code> parameter since this would cause an <i>MTConnect Agent</i> to repeatedly return the same data.</p> <p>If the value provided for the <code>at</code> parameter is a negative number or is not a, the <i>Request</i> <b>MUST</b> be determined to be invalid. The <i>MTConnect Agent</i> <b>MUST</b> return a 400 <i>HTTP Response Code</i>. Also, the <i>Agent</i> <b>MUST</b> publish an <i>Error Response Document</i> that identifies an <code>INVALID_REQUEST</code> <i>errorCode</i>.</p> <p>If the value provided for the <code>at</code> parameter is either lower than the value of <code>firstSequence</code> or greater than the value of <code>lastSequence</code>, the <i>Request</i> <b>MUST</b> be determined to be invalid. The <i>MTConnect Agent</i> <b>MUST</b> return a 404 <i>HTTP Response Code</i>. The <i>Agent</i> <b>MUST</b> also publish an <i>Error Response Document</i> that identifies an <code>OUT_OF_RANGE</code> <i>errorCode</i>.</p> <p>Note: Some information stored in the <i>buffer</i> of an <i>MTConnect Agent</i> may not be returned for a <i>Current Request</i> with a <i>Query</i> containing an <code>at</code> parameter if the <i>sequence number</i> associated with the most current value for that information is greater than the <i>sequence number</i> specified in the <i>Query</i>.</p>
interval	<p>When a <i>Current Request</i> includes a <i>Query</i> with the <code>interval</code> parameter, an <i>MTConnect Agent</i> <b>MUST</b> respond to this <i>Request</i> by repeatedly publishing the required <i>Response Document</i> at the time interval (period) defined by the value provided for the <code>interval</code> parameter.</p> <p>The value provided for <code>interval</code> <b>MUST</b> be expressed in milliseconds and <b>MUST</b> be a positive value greater than 0.</p> <p>The <code>interval</code> parameter <b>MUST NOT</b> be used in conjunction with the <code>at</code> parameter since this would cause an <i>MTConnect Agent</i> to repeatedly return the same data.</p> <p>If a <i>Request</i> contains a <i>Query</i> with an <code>interval</code> parameter, it <b>MUST</b> remain in effect until the client software application terminates its connection to the <i>Agent</i>.</p>

1408

1409 **8.3.2.3 Response to a Current Request**

1410 The *Response to a Current Request* **SHOULD** be an *MTConnectStreams Response Document* for  
 1411 one or more pieces of equipment designated by the *path* portion of the *Request*.

1412 The *Response to a Current Request* **MUST** always provide the most recent information available  
 1413 to an *MTConnect Agent* or, when the *at* parameter is specified, the value of the data at the given  
 1414 *sequence number*.

1415 The *Data Entities* provided in the *MTConnectStreams Response Document* will be limited to  
 1416 those specified in the combination of the *path* segment of the *Current Request* and the value of  
 1417 the *XPATH* defined for the *path* attribute provided in the *query* segment of that *Request*.

1418 **8.3.2.4 HTTP Status Codes for a Current Request**

1419 The following *HTTP Status Codes* **MUST** be supported as possible responses to a *Current*  
 1420 *Request*:

HTTP Status Code	Code Name	Description
200	OK	The <i>Request</i> was handled successfully.
400	Bad Request	If the <i>Request</i> could not be interpreted, the <i>MTConnect Agent</i> <b>MUST</b> return a 400 <i>HTTP Response Code</i> . Also, the <i>Agent</i> <b>MUST</b> publish an <i>Error Response Document</i> that identifies either an <code>INVALID_URI</code> , <code>INVALID_REQUEST</code> , or <code>INVALID_XPATH</code> as the <code>errorCode</code> .  If the <i>query</i> parameters do not contain a valid value or include an invalid parameter, the <i>MTConnect Agent</i> <b>MUST</b> return a 400 <i>HTTP Response Code</i> . Also, the <i>Agent</i> <b>MUST</b> publish an <i>Error Response Document</i> that identifies <code>QUERY_ERROR</code> as the <code>errorCode</code> .
404	Not Found	If the <i>Request</i> could not be interpreted, the <i>MTConnect Agent</i> <b>MUST</b> return a 404 <i>HTTP Response Code</i> . Also, the <i>Agent</i> <b>MUST</b> publish an <i>Error Response Document</i> that identifies <code>NO_DEVICE</code> as the <code>errorCode</code> .  If the value of the <i>at</i> parameter was greater than the <i>last sequence number</i> or is less than the <i>first sequence number</i> , the <i>MTConnect Agent</i> <b>MUST</b> return a 404 <i>HTTP Response Code</i> . Also, the <i>Agent</i> <b>MUST</b> publish an <i>Error Response Document</i> that identifies <code>OUT_OF_RANGE</code> as the <code>errorCode</code> .
405	Method Not Allowed	A method other than <code>GET</code> was specified in the <i>Request</i> or the piece of equipment specified in the <i>Request</i> could not be found.  The <i>MTConnect Agent</i> <b>MUST</b> return a 405 <i>HTTP Response Code</i> . Also, the <i>Agent</i> <b>MUST</b> publish an <i>Error Response Document</i> that identifies <code>UNSUPPORTED</code> as the <code>errorCode</code> .

HTTP Status Code	Code Name	Description
406	Not Acceptable	<p>The <i>HTTP Accept Header</i> in the <i>Request</i> was not one of the supported representations.</p> <p>The <i>MTConnect Agent</i> <b>MUST</b> return a 406 <i>HTTP Response Code</i>. Also, the <i>Agent</i> <b>MUST</b> publish an <i>Error Response Document</i> that identifies UNSUPPORTED as the <i>errorCode</i>.</p>
431	Request Header Fields Too Large	<p>The fields in the <i>Request</i> exceed the limit of the implementation of the <i>MTConnect Agent</i>.</p> <p>The <i>MTConnect Agent</i> <b>MUST</b> return a 431 <i>HTTP Response Code</i>. Also, the <i>Agent</i> <b>MUST</b> publish an <i>Error Response Document</i> that identifies INVALID_REQUEST as the <i>errorCode</i>.</p>
500	Internal Server Error	<p>There was an unexpected error in the <i>MTConnect Agent</i> while responding to a <i>Request</i>.</p> <p>The <i>MTConnect Agent</i> <b>MUST</b> return a 500 <i>HTTP Response Code</i>. Also, the <i>Agent</i> <b>MUST</b> publish an <i>Error Response Document</i> that identifies INTERNAL_ERROR as the <i>errorCode</i>.</p>

1421

### 1422 8.3.3 *Sample Request Implemented Using HTTP*

1423 An *MTConnect Agent* responds to a *Sample Request* with an *MTConnectStreams Response Document* that contains a set of values for *Data Entities* currently available for *Streaming Data* from the *Agent*, subject to any filtering defined in the *Request*.

1426 There are two forms to the *Sample Request*:

- 1427 • The first form is given without a specific path portion (name or uuid). In response to  
1428 this *Request*, the *MTConnect Agent* returns an *MTConnectStreams Response Document*  
1429 with information for all pieces of equipment represented in the *Agent*.

1430     1. http://<authority>/sample[?query]

- 1431 • The second form includes a specific path portion that defines either a name or uuid.  
1432 In response to this *Request*, the *MTConnect Agent* returns an *MTConnectStreams Response Document*  
1433 with information for only the one piece of equipment associated  
1434 with the name or uuid defined in the *Request*.

1435     1. http://<authority>/<name or uuid>/sample?query

1436

1437

1438 **8.3.3.1 Path Portion of the *HTTP Request Line* for a *Sample Request***

1439 The following segments of path **MUST** be supported in the *HTTP Request Line* for a *Sample*  
 1440 *Request*:

Path Segments	Description
name or UUID	<p>If present, specifies that only the <i>Data Entities</i> for the piece of equipment represented by the name or UUID will be published.</p> <p>If not present, <i>Data Entities</i> for all pieces of equipment associated with the <i>Agent</i> will be published.</p>
<request>	<p>Designates one of the following <i>Requests</i>: probe, current, sample, or asset(s).</p> <p>sample <b>MUST</b> be provided.</p>

1441

1442 **8.3.3.2 Query Portion of the *HTTP Request Line* for a *Sample Request***

1443 A *Query* may be used to more precisely define the specific information to be included in a  
 1444 *Response Document*. Multiple parameters may be used in a *Query* to further refine the  
 1445 information to be included. When multiple parameters are provided, each parameter is  
 1446 separated by an & character and each parameter appears only once in the *Query*. The parameters  
 1447 within the *Query* may appear in any sequence.

1448 The following query parameters **MUST** be supported in an *HTTP Request Line* for a *Sample*  
 1449 *Request*:

Query Parameters	Description
path	<p>An XPATH that defines specific information or a set of information to be included in an <i>MTConnectStreams Response Document</i>.</p> <p>The value for the XPATH is the location of the information defined in the <i>MTConnectDevices Information Model</i> that represents the <i>Structural Element(s)</i> and/or the specific <i>Data Entities</i> to be included in the <i>MTConnectStreams Response Document</i>.</p>

Query Parameters	Description
from	<p>The <code>from</code> parameter designates the <i>sequence number</i> of the first <i>Data Entity</i> in the <i>buffer</i> of the <i>MTConnect Agent</i> that <b>MUST</b> be included in the <i>Response Document</i>. The value for <code>from</code> <b>MUST</b> be an unsigned 64-bit integer.</p> <p>The <code>from</code> parameter is typically provided in conjunction with the <code>count</code> parameter. However, this is not required.</p> <p>If the <i>sequence number</i> provided as the value for the <code>from</code> parameter is 0, the information provided in the <i>Response Document</i> <b>MUST</b> be provided starting with the information located in the <i>buffer</i> of an <i>MTConnect Agent</i> defined by <code>firstSequence</code>.</p> <p>If no <i>sequence number</i> is provided as the value for the <code>from</code> parameter, the information provided in the <i>Response Document</i> <b>MUST</b> be provided starting with the information located in the <i>buffer</i> of an <i>MTConnect Agent</i> defined by <code>firstSequence</code>.</p> <p>If the <i>sequence number</i> provided as the value for the <code>from</code> parameter is a negative number, the request <b>MUST</b> be determined to be invalid and the <i>MTConnect Agent</i> <b>MUST</b> return a 400 <i>HTTP Response Code</i>. Also, the <i>Agent</i> <b>MUST</b> publish an <i>Error Response Document</i> that identifies an <code>INVALID_REQUEST</code> <i>errorCode</i>.</p> <p>If the value provided for the <code>from</code> parameter is either lower than the value of <code>firstSequence</code> or greater than the value of <code>lastSequence</code>, the request <b>MUST</b> be determined to be invalid and the <i>MTConnect Agent</i> <b>MUST</b> return a 404 <i>HTTP Response Code</i>. Also, the <i>Agent</i> <b>MUST</b> publish an <i>Error Response Document</i> that identifies an <code>OUT_OF_RANGE</code> <i>errorCode</i>.</p>
interval	<p>When a <i>Sample Request</i> includes a <i>Query</i> with the <code>interval</code> parameter, an <i>MTConnect Agent</i> <b>MUST</b> respond to this <i>Request</i> by repeatedly publishing the required <i>Response Document</i> at the time interval (period) defined by the value provided for the <code>interval</code> parameter.</p> <p>The value provided for <code>interval</code> <b>MUST</b> be expressed in milliseconds.</p> <p>The <code>interval</code> parameter <b>MUST NOT</b> be used in conjunction with the <code>at</code> parameter since this would cause an <i>MTConnect Agent</i> to repeatedly return the same data.</p> <p>If the value for the <code>interval</code> parameter is 0, the <i>MTConnect Agent</i> <b>MUST</b> provide successive <i>Response Documents</i> at the fastest rate that the <i>Agent</i> can support.</p> <p>If a <code>count</code> parameter is not provided in conjunction with an <code>interval</code> parameter, an <i>MTConnect Agent</i> <b>SHOULD</b> use a default value of 100 for <code>count</code>.</p> <p>If a <i>Request</i> contains a <i>Query</i> with an <code>interval</code> parameter, it <b>MUST</b> remain in effect until the client software application terminates its connection to the <i>Agent</i>.</p> <p>An <i>MTConnect Agent</i> <b>MUST NOT</b> publish a <i>Response Document</i> if no new data associated with the <i>Response Document</i> is available in the <i>buffer</i>. However, if new data associated with the <i>Response Document</i> is received by the <i>Agent</i> at a point in time after the value of the <code>interval</code> parameter is exceeded, the <i>Agent</i> <b>MUST</b> then publish a new version of the <i>Response Document</i> immediately.</p>

Query Parameters	Description
count	<p>The <code>count</code> parameter designates the total number of <i>Data Entities</i> to be published from the <i>buffer</i> of the <i>MTConnect Agent</i> in the <i>Response Document</i>.</p> <p>The <code>count</code> parameter is typically provided in conjunction with the <code>from</code> parameter. However, this is not required.</p> <p>If the value provided for the <code>count</code> parameter defines information located in the <i>buffer</i> of an <i>MTConnect Agent</i> that would be a <i>sequence number</i> greater than the value of <code>lastSequence</code>, the information provided <b>MUST</b> be limited only to the information available in the <i>buffer</i>.</p> <p>If no value is provided for the <code>count</code> parameter, the information provided in the <i>Response Document</i> <b>MUST</b> default to <code>count=100</code>.</p> <p>If the value provided for the <code>count</code> parameter is 0 or a negative number, the request <b>MUST</b> be determined to be invalid. The <i>MTConnect Agent</i> must return a 400 <i>HTTP Response Code</i>. Also, the <i>Agent</i> <b>MUST</b> publish an <i>Error Response Document</i> that identifies an <code>INVALID_REQUEST</code> <i>errorCode</i>.</p>
heartbeat	<p>Sets the time period for the <i>heartbeat</i> function in an <i>MTConnect Agent</i>.</p> <p>The value for <code>heartbeat</code> represents the amount of time after a <i>Response Document</i> has been published until a new <i>Response Document</i> <b>MUST</b> be published, even when no new data is available.</p> <p>The value for <code>heartbeat</code> is defined in milliseconds.</p> <p>If no value is defined for <code>heartbeat</code>, the value <b>SHOULD</b> default to 10 seconds.</p> <p><code>heartbeat</code> <b>MUST</b> only be specified if <code>interval</code> is also specified.</p>

1450

1451 **8.3.3.3 Response to a Sample Request**1452 The *Response* to a *Sample Request* **SHOULD** be an *MTConnectStreams Response Document* for  
1453 one or more pieces of equipment designated by the `path` portion of the *Request*.1454 The *Response* to a *Sample Request* **MUST** always provide the most recent information available  
1455 to an *MTConnect Agent* or, when the `at` parameter is specified, the value of the data at the given  
1456 *sequence number*.1457 The *Data Entities* provided in the *MTConnectStreams Response Document* will be limited to  
1458 those specified in the combination of the `path` segment of the *Sample Request* and the value of  
1459 the `XPATH` defined for the `path` attribute provided in the `query` segment of that *Request*.1460 When the value of `from` references the value of the next sequence number (`nextSequence`)  
1461 and there are no additional *Data Entities* available in the *buffer*, the response document will have  
1462 an empty `<Streams/>` element in the *MTConnectStreams* document to indicate no data is  
1463 available at the point in time that the *Agent* published the *Response Document*.

1464 **8.3.3.4 HTTP Status Codes for a Sample Request**

1465 The following *HTTP Status Codes* **MUST** be supported as possible responses to a *Sample*  
 1466 *Request*:

HTTP Status Code	Code Name	Description
200	OK	The <i>Request</i> was handled successfully.
400	Bad Request	If the <i>Request</i> could not be interpreted, the <i>MTConnect Agent</i> <b>MUST</b> return a 400 <i>HTTP Response Code</i> . Also, the <i>Agent</i> <b>MUST</b> publish an <i>Error Response Document</i> that identifies either an <code>INVALID_URI</code> , <code>INVALID_REQUEST</code> , or <code>INVALID_XPATH</code> as the <code>errorCode</code> .  If the <i>query parameters</i> do not contain a valid value or include an invalid parameter, The <i>MTConnect Agent</i> <b>MUST</b> return a 400 <i>HTTP Response Code</i> . Also, the <i>Agent</i> <b>MUST</b> publish an <i>Error Response Document</i> that identifies <code>QUERY_ERROR</code> as the <code>errorCode</code> .
404	Not Found	If the <i>Request</i> could not be interpreted, the <i>MTConnect Agent</i> <b>MUST</b> return a 404 <i>HTTP Response Code</i> . Also, the <i>Agent</i> <b>MUST</b> publish an <i>Error Response Document</i> that identifies <code>NO_DEVICE</code> as the <code>errorCode</code> .  If the value of the <code>at</code> <i>query parameter</i> was greater than the last sequence number or less than the first sequence number, the <i>MTConnect Agent</i> <b>MUST</b> return a 404 <i>HTTP Response Code</i> . Also, the <i>Agent</i> <b>MUST</b> publish an <i>Error Response Document</i> that identifies <code>OUT_OF_RANGE</code> as the <code>errorCode</code> .
405	Method Not Allowed	A method other than <code>GET</code> was specified in the <i>Request</i> or the piece of equipment specified in the <i>Request</i> could not be found.  The <i>MTConnect Agent</i> <b>MUST</b> return a 405 <i>HTTP Response Code</i> . Also, the <i>Agent</i> <b>MUST</b> publish an <i>Error Response Document</i> that identifies <code>UNSUPPORTED</code> as the <code>errorCode</code> .
406	Not Acceptable	The <i>HTTP Accept Header</i> in the <i>Request</i> was not one of the supported representations.  The <i>MTConnect Agent</i> <b>MUST</b> return a 406 <i>HTTP Response Code</i> . Also, the <i>Agent</i> <b>MUST</b> publish an <i>Error Response Document</i> that identifies <code>UNSUPPORTED</code> as the <code>errorCode</code> .
431	Request Header Fields Too Large	The fields in the <i>Request</i> exceed the limit of the implementation of the <i>MTConnect Agent</i> .  The <i>MTConnect Agent</i> <b>MUST</b> return a 431 <i>HTTP Response Code</i> . Also, the <i>Agent</i> <b>MUST</b> publish an <i>Error Response Document</i> that identifies <code>INVALID_REQUEST</code> as the <code>errorCode</code> .

HTTP Status Code	Code Name	Description
500	Internal Server Error	<p>There was an unexpected error in the <i>MTConnect Agent</i> while responding to a <i>Current Request</i>.</p> <p>The <i>MTConnect Agent</i> <b>MUST</b> return a 500 <i>HTTP Response Code</i>. Also, the <i>Agent</i> <b>MUST</b> publish an <i>Error Response Document</i> that identifies INTERNAL_ERROR as the errorCode.</p>

1467

### 1468 8.3.4 Asset Request Implemented Using HTTP

1469 An *MTConnect Agent* responds to an *Asset Request* with an *MTConnectAssets Response Document* that contains information for *MTConnect Assets* from the *Agent*, subject to any filtering defined in the *Request*.

1472 There are multiple forms to the *Asset Request*:

- 1473 • The first form is given without a specific path portion (name or uuid). In response to this *Request*, the *MTConnect Agent* returns an *MTConnetAssets Response Document* that contains information for all *Asset Document* represented in the *Agent*.

1476 1. http://<authority>/assets

- 1477 • The second form includes a specific path portion that defines the identity (asset\_id) for one or more specific *Asset Documents*. In response to this *Request*, the *MTConnect Agent* returns an *MTConnetAssets Response Document* that contains information for the specific *Assets* represented in the *Agent* and defined by each of the asset\_id values provided in the *Request*. Each asset\_id is separated by a ";".

1482 1. http://<authority>/asset/asset\_id;asset\_id;asset\_id....

1483 Note: An *HTTP Request Line* may include combinations of path and query to achieve the desired set of *Asset Documents* to be included in a specific *MTConnectAssets Response Document*.

#### 1486 8.3.4.1 Path Portion of the *HTTP Request Line* for an *Asset Request*

1487 The following segments of path **MUST** be supported in the *HTTP Request Line* for an *Asset Request*:

Path Segments	Description
<request>	Designates one of the following <i>Requests</i> : probe, current, sample, or asset(s). asset or assets <b>MUST</b> be provided.
asset_id	Identifies the id attribute of an <i>MTConnect Asset</i> to be provided by an <i>MTConnect Agent</i> .

1489

1490 **8.3.4.2 Query Portion of the *HTTP Request Line* for an *Asset Request***

1491 A *Query* may be used to more precisely define the specific information to be included in a  
 1492 *Response Document*. Multiple parameters may be used in a *Query* to further refine the  
 1493 information to be included. When multiple parameters are provided, each parameter is separated  
 1494 by an & character and each parameter appears only once in the *Query*. The parameters within the  
 1495 *Query* may appear in any sequence.

1496 The following *query* parameters **MUST** be supported in an *HTTP Request Line* for an *Asset*  
 1497 *Request*:

Query Parameters	Description
type	<p>Defines the type of <i>MTConnect Asset</i> to be returned in the <i>MTConnectAssets Response Document</i>.</p> <p>The type for an <i>Asset</i> is the term used in the <i>MTConnect Assets Information Model</i> to describe different types of <i>Assets</i>. It is the term that is substituted for the <i>Asset</i> container and describes the highest-level element in the <i>Asset</i> hierarchy. See <i>Part 4.0, Section 3.2.3</i> for more information on the type of an <i>Asset</i>.</p>
removed	<p><i>Assets</i> can have an attribute that indicates whether the <i>Asset</i> has been removed from a piece of equipment.</p> <p>The valid values for <i>removed</i> are true or false.</p> <p>If the value of the <i>removed</i> parameter in the <i>query</i> is true, then <i>Asset Documents for Assets</i> that have been marked as removed from a piece of equipment will be included in the <i>Response Document</i>.</p> <p>If the value of the <i>removed</i> parameter in the <i>query</i> is false, then <i>Asset Documents for Assets</i> that have been marked as removed from a piece of equipment will not be included in the <i>Response Document</i>.</p> <p>If <i>removed</i> is not defined in a <i>query</i>, the default value for <i>removed</i> <b>MUST</b> be determined to be false.</p>
count	<p>Defines the maximum number of <i>Asset Documents</i> to return in an <i>MTConnectAssets Response Document</i>.</p> <p>If <i>count</i> is not defined in the <i>query</i>, the default value for <i>count</i> <b>MUST</b> be determined to be 100.</p>

1498

1499 **8.3.4.3 Response to an *Asset Request***

1500 The *Response* to an *Asset Request* **SHOULD** be an *MTConnectAssets Response Document*  
 1501 containing information for one or more *Asset Documents* designated by the *Request*.

1502 The *Response* to an *Asset Request* **MUST** always provide the most recent information available  
 1503 to an *MTConnect Agent*.

1504 The *Asset Documents* provided in the *MTConnectAssets Response Document* will be limited to  
 1505 those specified in the combination of the path segment of the *Asset Request* and the parameters  
 1506 provided in the query segment of that *Request*.

1507 If the removed query parameter is not provided with a value of true, *Asset Documents* for  
 1508 Assets that have been marked as removed will not be provided in the response.

#### 1509 **8.3.4.4 HTTP Status Codes for a Sample Request**

1510 The following *HTTP Status Codes* **MUST** be supported as possible responses to an *Asset*  
 1511 *Request*:

HTTP Status Code	Code Name	Description
200	OK	The <i>Request</i> was handled successfully.
400	Bad Request	If the <i>Request</i> could not be interpreted, the <i>MTConnect Agent</i> <b>MUST</b> return a 400 <i>HTTP Response Code</i> . Also, the <i>Agent</i> <b>MUST</b> publish an <i>Error Response Document</i> that identifies either an INVALID_URI or INVALID_REQUEST as the errorCode.  If the query parameters do not contain a valid value or include an invalid parameter, The <i>MTConnect Agent</i> <b>MUST</b> return a 400 <i>HTTP Response Code</i> . Also, the <i>Agent</i> <b>MUST</b> publish an <i>Error Response Document</i> that identifies QUERY_ERROR as the errorCode.
404	Not Found	If the <i>Request</i> could not be interpreted, the <i>MTConnect Agent</i> <b>MUST</b> return a 404 <i>HTTP Response Code</i> . Also, the <i>Agent</i> <b>MUST</b> publish an <i>Error Response Document</i> that identifies NO_DEVICE or ASSET_NOT_FOUND as the errorCode.
405	Method Not Allowed	A method other than GET was specified in the <i>Request</i> or the piece of equipment specified in the <i>Request</i> could not be found.  The <i>MTConnect Agent</i> <b>MUST</b> return a 405 <i>HTTP Response Code</i> . Also, the <i>Agent</i> <b>MUST</b> publish an <i>Error Response Document</i> that identifies UNSUPPORTED as the errorCode.
406	Not Acceptable	The <i>HTTP Accept Header</i> in the <i>Request</i> was not one of the supported representations.  The <i>MTConnect Agent</i> <b>MUST</b> return a 406 <i>HTTP Response Code</i> . Also, the <i>Agent</i> <b>MUST</b> publish an <i>Error Response Document</i> that identifies UNSUPPORTED as the errorCode.
431	Request Header Fields Too Large	The fields in the <i>Request</i> exceed the limit of the implementation of the <i>MTConnect Agent</i> .  The <i>MTConnect Agent</i> <b>MUST</b> return a 431 <i>HTTP Response Code</i> . Also, the <i>Agent</i> <b>MUST</b> publish an <i>Error Response Document</i> that identifies INVALID_REQUEST as the errorCode.

HTTP Status Code	Code Name	Description
500	Internal Server Error	<p>There was an unexpected error in the <i>MTConnect Agent</i> while responding to a <i>Current Request</i>.</p> <p>The <i>MTConnect Agent</i> <b>MUST</b> return a 500 <i>HTTP Response Code</i>. Also, the <i>Agent</i> <b>MUST</b> publish an <i>Error Response Document</i> that identifies INTERNAL_ERROR as the errorCode.</p>

1512

### 1513 8.3.5 HTTP Errors

1514 When an *MTConnect Agent* receives an *HTTP Request* that is incorrectly formatted or is not  
 1515 supported by the *Agent*, the *Agent* **MUST** publish an *HTTP Error Message* which includes a  
 1516 specific status code from the tables above indicating that the *Request* could not be handled by the  
 1517 *Agent*.

1518 Also, if the *MTConnect Agent* experiences an internal error and is unable to provide the  
 1519 requested *Response Document*, it **MUST** publish an *HTTP Error Message* that includes a  
 1520 specific status code from the table above.

1521 When an *MTConnect Agent* encounters an error in interpreting or responding to an *HTTP*  
 1522 *Request*, the *Agent* **MUST** also publish an *MTConnectError Response Document* that  
 1523 provides additional details about the error. See *Section 9.0 – Error Information Model* for details  
 1524 on the *MTConnectError Response Document*.

### 1525 8.3.6 Data Streaming

1526 Since an *MTConnect Agent* **MUST** support a REST interface and it **MUST** support *HTTP*  
 1527 *Messaging*, it **MUST** also support *HTTP Data Streaming*. *HTTP Data Streaming* is a method for  
 1528 a server to provide a continuous stream of information in response to a single *Request* from a  
 1529 client software application. *Data Streaming* is a version of a *Publish/Subscribe* method of  
 1530 communications.

1531 For an *MTConnect Agent*, a *Data Streaming Request* is initiated by a client software application  
 1532 by making an *HTTP Request* to the *Agent* that includes a *Query* with an *interval* parameter.

1533 When an *MTConnect Agent* receives this *Request*, the *Agent* **MUST** respond by repeatedly  
 1534 publishing the appropriate *MTConnect Response Document*. Each version of the requested  
 1535 *Response Document* is published based on the time period defined by the *value* provided for the  
 1536 *interval* parameter included in the *Request*.

1537 Once initiated, a *Data Streaming Request* continues until either the *Agent* or the client software  
 1538 application terminates the connection between the *Agent* and the client.

1539

1540 If no new information is available in the *buffer* of the *MTConnect Agent* associated with the  
1541 requested *Response Document* and the time since the previous document was sent exceeds the  
1542 value of the *interval* parameter, the *Agent* **MUST NOT** publish a *Response Document*.  
1543 However, if new data associated with the *Response Document* is received by the *Agent* at a point  
1544 in time after the value of the *period* for the *interval* parameter is exceeded, the *Agent* **MUST**  
1545 then publish a new *Response Document* immediately.

1546 An *MTConnect Agent* **SHOULD** support any number of simultaneous and asynchronous *Data*  
1547 *Streaming Requests* with a single client or any number of client software application.

### 1548 8.3.6.1 *Heartbeat*

1549 When *Streaming Data* is requested from a *Sample Request*, an *MTConnect Agent* **MUST** support  
1550 a *heartbeat* to indicate to a client application that the HTTP connection is still viable during  
1551 times when there is no new data available to be published. The *heartbeat* is indicated by an  
1552 *MTConnect Agent* by sending an *MTConnect Response Document* with an empty *Streams*  
1553 container (See *Part 3, Section 4.1 Streams* for more details on the *Streams* container) to the client  
1554 software application.

1555 The *heartbeat* **MUST** occur on a periodic basis given by the optional *heartbeat* query  
1556 parameter or **MUST** default to 10 seconds. An *MTConnect Agent* **MUST** maintain a separate  
1557 *heartbeat* for each client application for which the *Agent* is responding to a *Data Streaming*  
1558 *Request*.

1559 An *MTConnect Agent* **MUST** begin calculating the interval for the time-period of the *heartbeat*  
1560 for each client application immediately after a *Response Document* is published to that specific  
1561 client application.

1562 The *heartbeat* remains in effect for each client software application until the *Data Streaming*  
1563 *Request* is terminated by either the *MTConnect Agent* or the client application.

1564

## 1565 9 Error Information Model

1566 The *Error Information Model* establishes the rules and terminology that describes the *Response*  
1567 *Document* returned by an *MTConnect Agent* when it encounters an error while interpreting a  
1568 *Request* for information from a client software application or when an *Agent* experiences an error  
1569 while publishing the *Response* to a *Request* for information.

1570 An *MTConnect Agent* provides the information regarding errors encountered when processing a  
1571 *Request* for information by publishing an *MTConnectError Response Document* to the client  
1572 software application that made the *Request* for information.

### 1573 9.1 MTConnectError Response Document

1574 The *MTConnectError Response Document* is comprised of two sections: *Header* and *Errors*.

1575 The *Header* section contains information defining the creation of the document and the data  
1576 storage capability of the *MTConnect Agent* that generated the document. (See *Section 6.5.4*  
1577 above.)

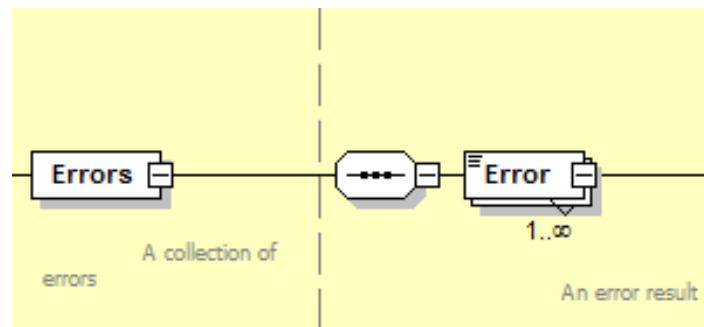

1578 The *Errors* section of the *MTConnectError Response Document* is a *Structural Element* that  
1579 organizes *Data Entities* describing each of the errors reported by an *MTConnect Agent*.

#### 1580 9.1.1 Structural Element for MTConnectError

1581 *Structural Elements* are XML elements that form the logical structure for an XML document.  
1582 The *MTConnectError Response Document* has only one *Structural Element*. This *Structural*  
1583 *Element* is *Errors*. *Errors* is an XML container element that organizes the information and  
1584 data associated with all errors relevant to a specific *Request* for information.

1585

1586 The following XML schema represents the structure of the `Errors` XML element.

1587

**Figure 14: Errors Schema Diagram**

1588

Element	Description	Occurrence
Errors	<p>An XML container element in an <i>MTConnectError Response Document</i> provided by an <i>MTConnect Agent</i> when an error is encountered associated with a <i>Request</i> for information from a client software application.</p> <p>There <b>MUST</b> be only one <code>Errors</code> element in an <i>MTConnectError Response Document</i>.</p> <p>The <code>Errors</code> element <b>MUST</b> contain at least one <code>Error Data Entity</code> element.</p>	1

1590

1591 Note: When compatibility with *Version 1.0.1* and earlier of the MTConnect Standard is  
 1592 required for an implementation, the *MTConnectErrors Response Document* contains  
 1593 only a single `Error Data Entity` and the `Errors Structural Element` **MUST NOT**  
 1594 appear in the document.

### 1595 **9.1.2 Error Data Entity**

1596 When an *MTConnect Agent* encounters an error when responding to a *Request* for information  
 1597 from a client software application, the information describing the error(s) is reported as a *Data*  
 1598 *Entity* in an *MTConnectError Response Document*. *Data Entities* are organized in the `Errors`  
 1599 XML container.

1600 There is only one type of *Data Entity* defined for an *MTConnectError Response Document*. That  
 1601 *Data Entity* is called `Error`.

1602

1603 The following is an illustration of the structure of an XML document demonstrating how **Error**  
 1604 **Data Entities** are reported in an *MTConnectError Response Document*:

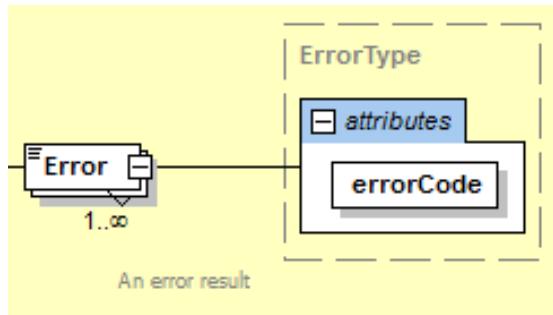

```
1605 1.  <MTConnectError>
1606 2.    <Header/>
1607 3.    <Errors>
1608 4.      <Error/>
1609 5.      <Error/>
1610 6.      <Error/>
1611 7.    </Errors>
1612 8.  </MTConnectError>
```

1613 The **Errors** element **MUST** contain at least one *Data Entity*. Each *Data Entity* describes the  
 1614 details for a specific error reported by an *MTConnect Agent* and is represented by the XML  
 1615 element named **Error**.

1616 **Error** XML elements **MAY** contain both attributes and CDATA that provide details further  
 1617 defining a specific error. The CDATA **MAY** provide the complete text provided by an  
 1618 *MTConnect Agent* for the specific error.

### 1619 **9.1.2.1 XML Schema Structure for Error**

1620 The following XML schema represents the structure of an **Error** XML element showing the  
 1621 attributes defined for **Error**.

1622  
 1623 **Figure 15: Error Schema Diagram**

1624

### 1625 **9.1.2.2 Attributes for Error**

1626 **Error** has one attribute. The following table defines this attribute that provides additional  
 1627 information for an **Error** XML element.

Attribute	Description	Occurrence
errorCode	Provides a descriptive code that indicates the type of error that was encountered by an <i>MTConnect Agent</i> when attempting to respond to a <i>Request</i> for information.  errorCode is a required attribute.	1

1628

1629 **9.1.2.3 Values for errorCode**

1630 There is a limited vocabulary defined for `errorCode`. The value returned for `errorCode`  
 1631 **MUST** be one of the following:

Value for <code>errorCode</code>	Description
ASSET_NOT_FOUND	The <i>Request</i> for information specifies an <i>MTConnect Asset</i> that is not recognized by the <i>MTConnect Agent</i> .
INTERNAL_ERROR	The <i>MTConnect Agent</i> experienced an error while attempting to published the requested information.
INVALID_REQUEST	The <i>Request</i> contains information that was not recognized by the <i>MTConnect Agent</i> .
INVALID_URI	The URI provided was incorrect.
INVALID_XPATH	The XPATH identified in the <i>Request</i> for information could not be parsed correctly by the <i>MTConnect Agent</i> . This could be caused by an invalid syntax or the XPATH did not match a valid identify for any information stored in the <i>Agent</i> .
NO_DEVICE	The identity of the piece of equipment specified in the <i>Request</i> for information is not associated with the <i>MTConnect Agent</i> .
OUT_OF_RANGE	The <i>Request</i> for information specifies <i>Steaming Data</i> that includes sequence number(s) for pieces of data that are beyond the end of the <i>buffer</i> .
QUERY_ERROR	The <i>MTConnect Agent</i> was unable to interpret the <i>Query</i> . The <i>Query</i> parameters do not contain valid values or include an invalid parameter.
TOO_MANY	<p>The <code>count</code> parameter provided in the <i>Request</i> for information requires either of the following:</p> <ul style="list-style-type: none"> <li>– <i>Steaming Data</i> that includes more pieces of data than the <i>MTConnect Agent</i> is capable of organizing in an <i>MTConnectStreams Response Document</i>.</li> <li>– <i>Assets</i> that include more <i>Asset Documents</i> in an <i>MTConnectAssets Response Document</i> than the <i>MTConnect Agent</i> is capable of handling.</li> </ul>
UNAUTHORIZED	The <i>Requestor</i> does not have sufficient permissions to access the requested information.
UNSUPPORTED	A valid <i>Request</i> was provided, but the <i>MTConnect Agent</i> does not support the feature or type of <i>Request</i> .

1632

1633 **9.1.2.4 CDATA for Error**

1634 The CDATA for `Error` contains a textual description of the error and any additional information  
 1635 an *MTConnect Agent* is capable of providing regarding a specific error. The *Valid Data Value*  
 1636 returned for `Error` **MAY** be any text string.

1637 **9.1.3 Examples for MTConnectError**

1638 The following is an example demonstrating the structure of an *MTConnectError Response Document*:

```

1640 1.  <?xml version="1.0" encoding="UTF-8"?>
1641 1.  <MTConnectError xmlns="urn:mtconnect.org:MTConnectError:1.4"
1642 2.    xmlns:xsi=http://www.w3.org/2001/XMLSchema-instance
1643 3.    xsi:schemaLocation="urn:mtconnect.org:MTConnectError:1.4
1644 4.      /schemas/MTConnectError_1.4.xsd">
1645 5.      <Header creationTime="2010-03-12T12:33:01Z"
1646 6.          sender="MyAgent" version="1.4.1.10" bufferSize="131000"
1647 7.          instanceId="1383839" />
1648 8.      <Errors>
1649 9.          <Error errorCode="OUT_OF_RANGE" >Argument was out of
1650 10.             range</Error>
1651 11.          <Error errorCode="INVALID_XPATH" >Bad path</Error>
1652 12.      </Errors>
1653 13.  </MTConnectError>
```

1654 The following is an example demonstrating the structure of an *MTConnectError Response Document* when backward compatibility with *Version 1.0.1* and earlier of the MTConnect Standard is required. In this case, the *Document Body* contains only a single *Error Data Entity* and the *Errors Structural Element MUST NOT* appear in the document.

```

1658 1.  <?xml version="1.0" encoding="UTF-8"?>
1659 2.  <MTConnectError xmlns="urn:mtconnect.org:MTConnectError:1.1"
1660 3.    xmlns:xsi=http://www.w3.org/2001/XMLSchema-instance
1661 4.    xsi:schemaLocation="urn:mtconnect.org:MTConnectError:1.1
1662 5.      /schemas/MTConnectError_1.1.xsd">
1663 6.      <Header creationTime="2010-03-12T12:33:01Z"
1664 7.          sender="MyAgent" version="1.1.0.10" bufferSize="131000"
1665 8.          instanceId="1383839" />
1666 9.          <Error errorCode="OUT_OF_RANGE" >Argument was out of
1667 10.             range</Error>
1668 11.  </MTConnectError>
```

## Appendix B

### Fundamentals of Using XML to Encode *Response Documents*

The MTConnect Standard specifies the structures and constructs that are used to encode *Response Documents*. When these *Response Documents* are encoded using XML, there are additional rules defined by the XML standard that apply for creating an XML compliant document. An implementer should refer to the W3C website for additional information on XML documentation and implementation details - <http://www.w3.org/XML>.

The following provides specific terms and guidelines referenced in the MTConnect Standard for forming *Response Documents* with XML:

- Tag: A tag is an XML construct that forms the foundation for an XML expression. It defines the scope (beginning and end) of an XML expression. The main types of tags are:
  - start-tag: Designates the beginning on an XML element; e.g., <*Element Name*>
  - end-tag: Designates the end on an XML element; e.g., </*Element Name*>.

Note: If an element has no *Child Elements* or CDATA, the end-tag may be shortened to />.

- Element: An element is an XML statement that is the primary building block for a document encoded using XML. An element begins with a start-tag and ends with a matching end-tag. The characters between the start-tag and the end-tag are the element's content. The content may contain attributes, CDATA, and/or other elements. If the content contains additional elements, these elements are called *Child Elements*.

An example would be: <*Element Name*>Content of the Element</*Element Name*>.

- Child Element: An XML element that is contained within a higher-level Parent Element. A *Child Element* is also known as a sub-element. XML allows an unlimited hierarchy of *Parent-Child Element* relationships that establishes the structure that defines how the various pieces of information in the document relate to each other. A *Parent Element* may have multiple associated *Child Elements*.
- Element Name: A descriptive identifier contained in both the start-tag and end-tag that provides the name of an XML element.
- Attribute: A construct consisting of a name–value pair that provides additional information about that XML element. The format for an attribute is name="value"; where the value for the attribute is enclosed in a set of quotation ("") marks. An XML attribute **MUST** only have a single value and each attribute can appear at most once in each element. Also, each attribute **MUST** be defined in a *schema* to either be required or optional.

- 1750 • An example of attributes for an XML element are:

1751 1. <DataItem category="SAMPLE" id="S1load" nativeUnits="PERCENT"  
 1752 2. type="LOAD" units="PERCENT"/>

1753 In this example, DataItem is the Element Name. category, id, nativeUnits,  
 1754 type, and units are the names of the attributes. "SAMPLE", "S1load",  
 1755 "PERCENT", "LOAD, and "PERCENT" are the values for each of the respective  
 1756 attributes.

- 1757 • CDATA: CDATA is an XML term representing *Character Data*. *Character Data*  
 1758 contains a value(s) or text that is associated with an XML element. CDATA can be  
 1759 restricted to certain formats, patterns, or words.

1760 An example of CDATA associated with an XML element would be:

1761 1. <Message id="M1">This is some text</Message>

1762 In this example, Message is the Element Name and This is some text is the  
 1763 CDATA.

- 1764 • *namespace*: An XML *namespace* defines a unique vocabulary for named elements and  
 1765 attributes in an XML document. An XML document may contain content that is  
 1766 associated with multiple *namespaces*. Each *namespace* has its own unique identifier.

1767 Elements and attributes are associated with a specific *namespace* by placing a prefix on  
 1768 the name of the element or attribute that associates that name to a specific *namespace*;  
 1769 e.g., x:MyTarget associates the element name MyTarget with the *namespace*  
 1770 designated by x: (the prefix).

1771 *namespaces* are used to avoid naming conflicts within an XML document. The naming  
 1772 convention used for elements and attributes may be associated with either the default  
 1773 *namespace* specified in the *header* of an XML document or they may be associated with  
 1774 one or more alternate namespaces. All elements or attributes associated with a  
 1775 *namespace* that is not the default namespace, must include a prefix (e.g., x:) as part of  
 1776 the name of the element or attribute to associate it with the proper *namespace*. See  
 1777 Appendix C for details on the structure for XML *headers*.

1778 The names of the elements and attributes declared in a *namespace* may be identified  
 1779 with a different prefix than the prefix that signifies that specific *namespace*. These  
 1780 prefixes are called *namespace aliases*. As an example, MTConnect Standard specific  
 1781 *namespaces* are designated as m: and the names of the elements and attributes defined  
 1782 in that *namespace* have an *alias* prefix of mt: which designates these names as  
 1783 MTConnect Standard specific vocabulary; e.g., mt:MTConnectDevices.

1784 XML documents are encoded with a hierarchy of elements. In general, XML elements may  
 1785 contain *Child Elements*, CDATA, or both. However, in the MTConnect Standard, an element  
 1786 **MUST NOT** contain mixed content; meaning it cannot contain both *Child Elements* and  
 1787 CDATA.

1788 The *semantic data model* defined for each *Response Document* specifies the elements and *Child*  
1789 *Elements* that may appear in a document. The *semantic data model* also defines the number of  
1790 times each element and *Child Element* may appear in the document.

1791 The following example demonstrates the hierarchy of XML elements and *Child Elements* used to  
1792 form an XML document:

```
1793 1.  <Root Level> (Parent Element)
1794 2.  <First Level> (Child Element to Root Level and Parent Element to Second Level)
1795 3.  <Second Level> (Child Element to First Level and Parent Element to Third Level)
1796 4.  <Third Level name="N1"></Third Level> (Child Element to Second Level)
1797 5.  <Third Level name="N2"></Third Level> (Child Element to Second Level)
1798 6.  <Third Level name="N3"></Third Level> (Child Element to Second Level)
1799 7.  </Second Level> (end-tag for Second Level)
1800 8.  </First Level> (end-tag for First Level)
1801 9.  </Root Level> (end-tag for Root Level)
```

1802 In the above example, *Root Level* and *First Level* have one *Child Element* (sub-elements) each  
1803 and *Second Level* has three *Child Elements*; each called *Third Level*. Each *Third Level* element  
1804 has a different name attribute. Each level in the structure is an element and each lower level  
1805 element is a *Child Element*.

1806

## Appendix C

### Schema and Namespace Declaration Information

There are four pseudo-attributes typically included in the *Header* of a *Response Document* that declare the *schema* and *namespace* for the document. Each of these pseudo-attributes provides specific information for a client software application to properly interpret the content of the *Response Document*.

The pseudo-attributes include:

- `xmllns:xsi` – The `xsi` portion of this attribute name stands for *XML Schema Instance*. An *XML Schema Instance* provides information that may be used by a software application to interpret XML specific information within a document. See the W3C website for more details on `xmllns:xsi`.
- `xmllns` – Declares the default *namespace* associated with the content of the *Response Document*. The default *namespace* is considered to apply to all elements and attributes whenever the name of the element or attribute does not contain a prefix identifying an alternate *namespace*.

The value of this attribute is an URN identifying the name of the file that defines the details of the *namespace* content. This URN provides a unique identify for the *namespace*.

- `xmllns:m` – Declares the MTConnect specific *namespace* associated with the content of the *Response Document*. There may be multiple *namespaces* declared for an XML document. Each may be associated to the default *namespace* or it may be totally independent. The `:m` designates that this is a specific MTConnect *namespace* which is directly associated with the default *namespace*.

Note: See *Section 6.7, Extensibility* for details regarding extended *namespaces*.

The value associated with this attribute is an URN identifying the name of the file that defines the details of the *namespace* content.

- 1834     • `xsi:schemaLocation` - Declares the name for the *schema* associated with the  
 1835       *Response Document* and the location of the file that contains the details of the *schema*  
 1836       for that document.

1837     The value associated with this attribute has two parts:

- 1838       – A URN identifying the name of the specific *XML Schema Instance* associated  
 1839       with the *Response Document*.
- 1840       – The path to the location where the file describing the specific *XML Schema*  
 1841       *Instance* is located. If the file is located in the same root directory where the  
 1842       *MTConnect Agent* is installed, then the local path **MAY** be declared. Otherwise, a  
 1843       fully qualified URL must be declared to identify the location of the file.

1844     Note: In the format of the value associated with `xsi:schemaLocation`, the URN  
 1845       and the path to the *schema* file **MUST** be separated by a “space”.

1846     In the following example, the first line is the *XML Declaration*. The second line is a *Root*  
 1847       *Element* called `MTConnectDevices`. The remaining four lines are the pseudo-attributes of  
 1848       `MTConnectDevices` that declare the *XML schema* and *namespace* associated with an  
 1849       *MTConnectDevices Response Document*.

```
1850     1. <?xml version="1.0" encoding="UTF-8"?>
1851     2.   <MTConnectDevices
1852     3.     xmlns:xsi=http://www.w3.org/2001/XMLSchema-instance
1853     4.     xmlns="urn:mtconnect.org:MTConnectDevices:1.3"
1854     5.     xmlns:m="urn:mtconnect.org:MTConnectDevices:1.3"
1855     6.     xsi:schemaLocation="urn:mtconnect.org:
1856     7.       MTConnectDevices:1.3 /schemas/MTConnectDevices_1.3.xsd">
```

1857     The format for the values provided for each of the pseudo-attributes **MUST** reference the  
 1858       *semantic data model* (e.g., `MTConnectDevices`, `MTConnectStreams`,  
 1859       `MTConnectAssets`, or `MTConnectError`) and the version (i.e.; 1.1, 1.2, 1.3, etc.) of  
 1860       the *MTConnect Standard* that depict the *schema* and *namespace(s)* associated with a specific  
 1861       *Response Document*.

1862     When an implementer chooses to extend an *MTConnect Data Model* by adding custom data  
 1863       types or additional *Structural Elements*, the *schema* and *namespace* for that *Data Model*  
 1864       should be updated to reflect the additional content. When this is done, the *namespace* and  
 1865       *schema* information in the *Header* should be updated to reflect the URI for the extended  
 1866       *namespace* and *schema*.

# MTConnect® Standard

## 1    1 Purpose of This Document

2    This document, *Part 2.0 – Devices Information Model* of the MTConnect® Standard, establishes  
3    the rules and terminology to be used by designers to describe the function and operation of a  
4    piece of equipment and to define the data that is provided by an *MTConnect Agent* from the  
5    equipment. The *Devices Information Model* also defines the structure for the XML document  
6    that is returned from a *MTConnect Agent* in response to a *Probe Request*.

7    In the MTConnect Standard, *equipment* represents any tangible property that is used in the  
8    operations of a manufacturing facility. Examples of *equipment* are machine tools, ovens, sensor  
9    units, workstations, software applications, and bar feeders.

10

11    Note: See *Part 3.0 – Streams Information Model* of the MTConnect Standard for details on  
12    the XML documents that are returned from a *MTConnect Agent* in response to a  
13    *Sample* or *Current Request*.

14

## 15    2 Terminology and Conventions

- 16 Refer to *Section 2 of Part 1.0 – Overview and Functionality* for a dictionary of terms, reserved  
17 language, and document conventions used in the MTConnect Standard.

## 18    3 Devices Information Model

19    The *Devices Information Model* represents the physical and logical configuration for a piece of  
20   equipment used for a manufacturing process or for any other purpose. It also provides the  
21   definition of data that may be reported by that equipment.

22   Using information defined in the *Devices Information Model*, a software application can  
23   determine the configuration and reporting capabilities of a piece of equipment. To do this, the  
24   software application issues a *Probe Request* (defined in *Section 8.1.1 of Part 1.0 – Overview and*  
25   *Functionality* of the MTConnect Standard) to a *MTConnect® Agent* associated with a piece of  
26   equipment. A *MTConnect Agent* responds to the *Probe Request* with an *MTConnectDevices*  
27   XML document that contains information describing both the physical and logical structure of  
28   the piece of equipment and a detailed description of each *Data Entity* that can be reported by the  
29   *Agent* associated with the piece of equipment. This information allows the client software  
30   application to interpret the document and to extract the data with the same meaning, value, and  
31   context that it had at its original source.

32   The *MTConnectDevices* XML document is comprised of two sections: *Header* and  
33   *Devices*.

34   The *Header* section contains protocol related information as defined in *Section 6.5.1 of Part*  
35   *1.0 – Overview and Functionality* of the MTConnect Standard.

36   The *Devices* section of the *MTConnectDevices* document contains a *Device* XML  
37   container for each piece of equipment described in the document. Each *Device* container is  
38   comprised of two primary types of XML elements – *Structural Elements* and *Data Entities*.

39   *Structural Elements* are defined as XML elements that organize information that represents the  
40   physical and logical parts and sub-parts of a piece of equipment (See *Section 4* of this document  
41   for more details).

42   *Data Entities* are defined as XML elements that describe data that can be reported by a piece of  
43   equipment. In the *Devices Information Model*, *Data Entities* are defined as *DataItem* elements  
44   (See *Section 7* and *8* of this document).

45   The *Structural Elements* and *Data Entities* in the *MTConnectDevices* document provide  
46   information representing the physical and logical structure for a piece of equipment and the types  
47   of data that the piece of equipment can report relative to that structure. The  
48   *MTConnectDevices* document does not contain values for the data types reported by the  
49   piece of equipment. The *MTConnectStreams* document defined in *Part 3.0 – Streams*  
50   *Information Model* provides the data values that are reported by the piece of equipment. As  
51   such, most *Structural Elements* and *Data Entities* in the *MTConnectDevices* document do  
52   not contain CDATA. XML elements that provide values or information in the CDATA will be  
53   specifically identified in *Sections 4, 7, and 9* of this document.

54

55

56 Note: The MTConnect Standard also defines the information model for *Assets*. An *Asset* is  
57 something that is used in the manufacturing process, but is not permanently associated  
58 with a single piece of equipment, can be removed from the piece of equipment without  
59 compromising its function, and can be associated with other pieces of equipment  
60 during its lifecycle. See *Part 4.0 – Assets* of the MTConnect Standard for more details  
61 on *Assets*.

## 62    4 Structural Elements for MTConnectDevices

63    *Structural Elements* are XML elements that form the logical structure for the  
 64    MTConnectDevices XML document. These elements are used to organize information that  
 65    represents the physical and logical architecture of a piece of equipment. Refer to *Figure 1* below  
 66    for an overview of the *Structural Elements* used in an MTConnectDevices document.

67    A variety of *Structural Elements* are defined to describe a piece of equipment. Some of these  
 68    elements **MUST** always appear in the MTConnectDevices XML document, while others are  
 69    optional and **MAY** be used, as required, to provide additional structure.

70    The first, or highest level, *Structural Element* in a MTConnectDevices XML document is  
 71    **Devices**. **Devices** is a container type XML element used to group one or more pieces of  
 72    equipment into a single XML document. **Devices** **MUST** always appear in the  
 73    MTConnectDevices document.

74    **Device** is the next *Structural Element* in the MTConnectDevices XML document.  
 75    **Device** is also a container type XML element. A separate **Device** container is used to identify  
 76    each piece of equipment represented in the MTConnectDevices document. Each **Device**  
 77    container provides information on the physical and logical structure of the piece of equipment  
 78    and the data associated with that equipment. **Device** can also represent any logical grouping of  
 79    pieces of equipment that function as a unit or any other data source that provides data through a  
 80    *MTConnect Agent*.

81    One or more **Device** element(s) **MUST** always appear in an MTConnectDevices document.

82    **Components** is the next *Structural Element* in the MTConnectDevices XML document.  
 83    **Components** is also a container type XML element. **Components** is used to group  
 84    information describing *Lower Level* physical parts or logical functions of a piece of equipment.

85    If the **Components** container appears in the XML document, it **MUST** contain one or more  
 86    **Component** type XML elements.

87    **Component** is the next level of *Structural Element* in the MTConnectDevices XML  
 88    document. **Component** is both an abstract type XML element and a container type element.

89    As an abstract type element, **Component** will never appear in the XML document describing a  
 90    piece of equipment and will be replaced by a specific **Component** type defined in *Section 5*.  
 91    Each **Component** type is also a container type element. As a container, the **Component** type  
 92    element is used to organize information describing *Lower Level Structural Elements* or *Data*  
 93    *Entities* associated with the **Component**.

94    If *Lower Level Structural Elements* are described, these elements are by definition child  
 95    **Component** elements of a parent **Component**. At this next level, the *Lower Level* child  
 96    **Component** elements are grouped into an XML container called **Components**.

97

98 This *Lower Level* Components container is comprised of one or more child Component  
 99 XML elements representing the sub-parts of the parent Component. Just like the parent  
 100 Component element, the child Component element is an abstract type XML element and will  
 101 never appear in the XML document – only the different *Lower Level* child Component types  
 102 will appear.

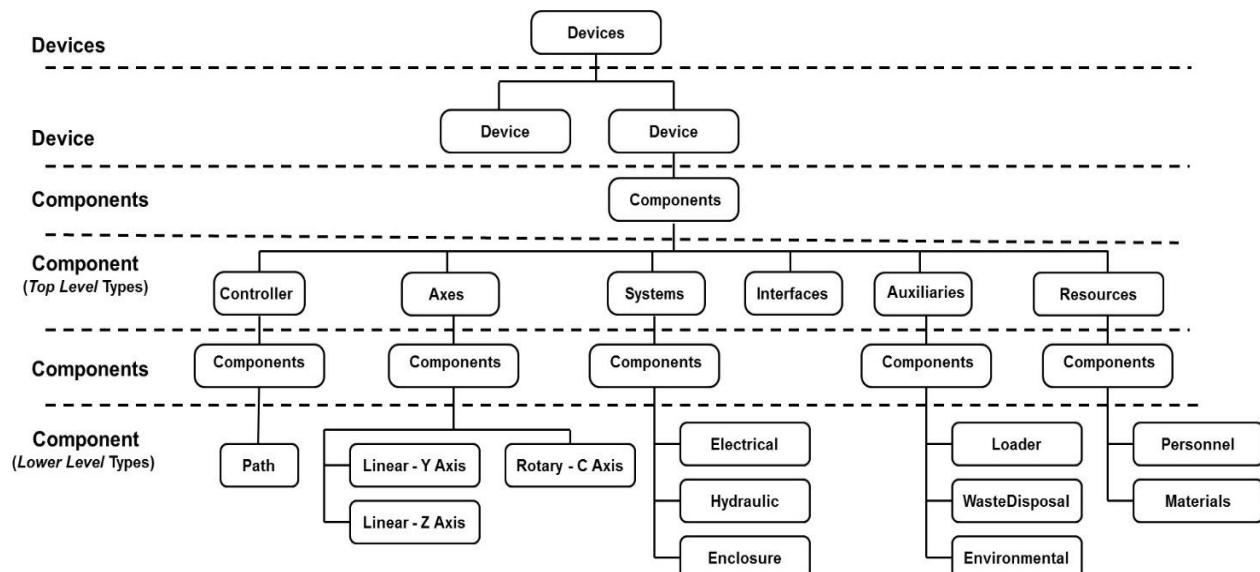

103 This parent-child relationship can continue to any depth required to fully define a piece of  
 104 equipment.

105 The following example is an XML document structure that demonstrates the relationship  
 106 between a parent Component and *Lower Level* child components :

```
107 1. <Devices>
108 2.   <Device>
109 3.     <Components>
110 4.       <Axes>  (Parent component)
111 5.         <Components>
112 6.           <Rotary>  (Child component to Axes and Parent component to
113 7.             Lower Level components)
114 8.         <Components>
115 9.           <Chuck>  (Child component to Rotary)
```

116 The following XML Tree demonstrates the various *Structural Elements* provided to describe a  
 117 piece of equipment and the relationship between these elements.

118

119

120 **Figure 1: Example Device Structural Elements**

121

122

123 Component type XML elements **MAY** be further decomposed into Composition type XML  
124 elements. Composition elements describe the lowest level basic structural or functional  
125 building blocks contained within a Component. Any number of Composition elements  
126 **MAY** be used. Data provided for a Component provides more specific meaning when it is  
127 associated with one of the Composition elements of the Component. The different  
128 Composition types that **MAY** appear in the XML document are defined in *Section 6*.

129 The Composition elements are organized into a Compositions container. The  
130 Compositions container **MAY** appear in the XML document further describing a  
131 Component. If one or more Composition element(s) is provided to describe a  
132 Component, a Compositions container **MUST** be defined for the Component.

133 The following illustration represents an XML document structure that demonstrates the  
134 relationship between a parent Component and its Composition elements :

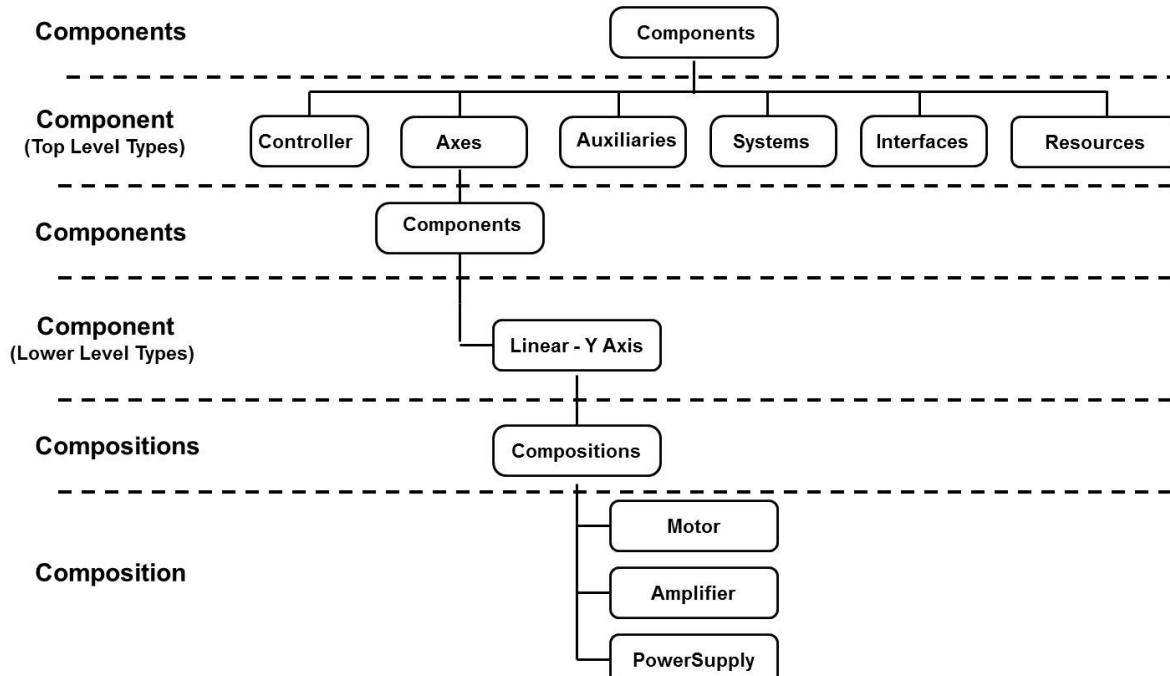

135 1. <Devices>  
136 2. <Device>  
137 3. <Components>  
138 4. <Axes> (**Component**)  
139 5. <Components>  
140 6. <Linear> (**Component**)  
141 7. <Compositions>  
142 8. <Composition>  
143 9. <Composition>  
144 10. <Composition>

145

146

147 The following XML Tree demonstrates this relationship between a Component and some of its  
 148 potential Composition elements.

149

150

151

152 **Figure 2: Example Composition Structural Elements**

153

#### 154 **4 . 1 Devices**

155 Devices is a container type XML element that **MUST** contain only Device elements.  
 156 Devices **MUST** contain at least one Device element, but **MAY** contain multiple Device  
 157 elements. *Data Entities* **MAY NOT** be directly associated with the Devices container.

Element	Description	Occurrence
Devices	The first, or highest level, <i>Structural Element</i> in a MTConnectDevices document. Devices is a container type XML element.	1

158

159 **4 . 2 Device**

160 Device is an XML container type element that organizes the *Structural Elements* and *Data Entities* associated with a piece of equipment. *Data Entities* **MAY** be directly associated with  
 161 the Device container. Device **MUST** provide the data item AVAILABILITY, which  
 162 represents the *Agent's* ability to communicate with the data source.

164 In the MTConnectDevices XML document, Device is a unique type of *Structural Element*.  
 165 Device carries all of the properties of a Component (see *Section 4.4*). Additionally, Device  
 166 **MUST** have a `uuid` attribute that uniquely identifies the piece of equipment. The value for the  
 167 `uuid` **SHOULD NOT** change over time. The value for `uuid` **MUST** be universally unique and  
 168 **MUST** only appear once in any MTConnect installation. All *Structural Elements* and *Data Entities*  
 169 associated with a piece of equipment are therefore uniquely identified through their  
 170 association with the Device container.

Element	Description	Occurrence
Device	The primary container element for each piece of equipment. Device is organized within the Devices container. There <b>MAY</b> be multiple Device elements in an XML document.	1..INF

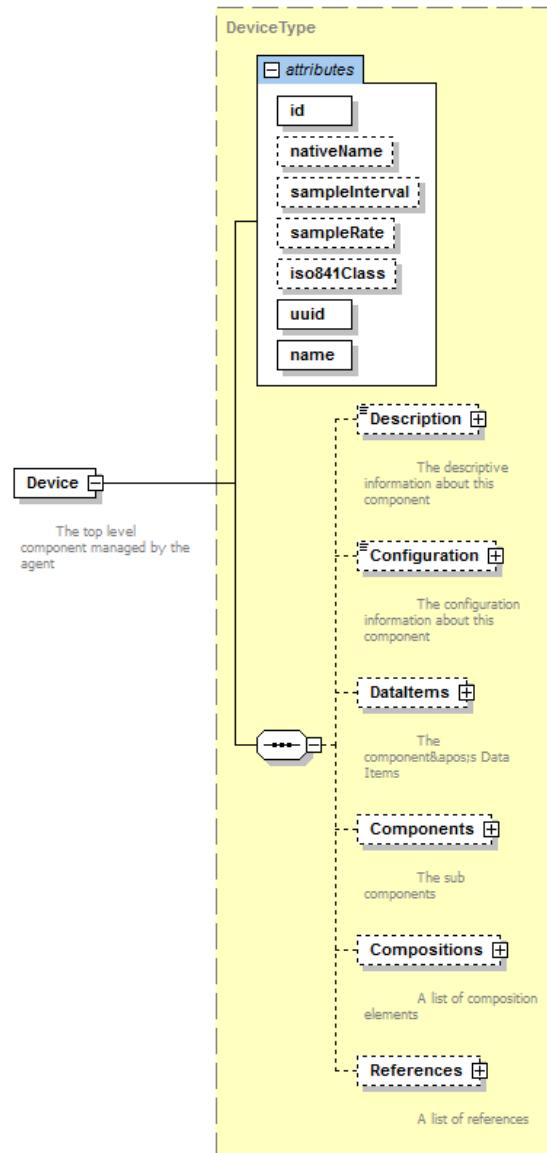

171  
 172 Note: Some data sources may not be integral to a specific piece of equipment. These data  
 173 sources may function independently or produce data that is not relevant to a specific  
 174 piece of equipment. An example would be a temperature sensor installed in a plant to  
 175 monitor the ambient air temperature. In such a case, these individual data sources, if  
 176 they singularly or together perform a unique function, **MAY** be modeled in a  
 177 MTConnect XML document as a Device. When modeled as a Device, these data  
 178 sources **MUST** provide all of the data and capabilities defined for a Device.

179 It is possible for a piece of equipment to be defined as both a Component of a Device and  
 180 simultaneously function independently as a separate Device reporting data directly through a  
 181 MTConnect Agent using its own `uuid`. An example would be a temperature monitoring system  
 182 that is defined as a Device reporting data about the environment within a facility and  
 183 simultaneously reporting data for a Component of another piece of equipment that it is  
 184 monitoring.

185

## 186 4.2.1 XML Schema Structure for Device

187 The following XML schema represents the structure of the `Device` XML element showing the  
 188 attributes defined for `Device` and the elements that may be associated with `Device`.

189  
 190

**Figure 3: Device Schema Diagram**

## 191 4.2.2 Attributes for Device

192 The following table defines the attributes that may be used to provide additional information for  
 193 a Device type element.

Attribute	Description	Occurrence
<code>id</code>	<p>The unique identifier for this XML element.  <code>id</code> is a required attribute.            An <code>id</code> <b>MUST</b> be unique across all the <code>id</code> attributes in the document.            An XML ID-type.</p>	1
<code>nativeName</code>	<p>The common name normally associated with this piece of equipment.  <code>nativeName</code> is an optional attribute.</p>	0..1
<code>sampleInterval</code>	<p>An optional attribute that is an indication provided by a piece of equipment describing the interval in milliseconds between the completion of the reading of the data associated with the <code>Device</code> element until the beginning of the next sampling of that data. This indication is reported as the number of milliseconds between data captures.</p> <p>This information may be used by client software applications to understand how often information from a piece of equipment is expected to be refreshed.</p> <p>The refresh rate for all data from the piece of equipment will be the same as for the <code>Device</code> element unless specifically overridden by another <code>sampleInterval</code> provided for a <code>Component</code> of the <code>Device</code> element.</p> <p>If the value of <code>sampleInterval</code> is less than one millisecond, the value will be represented as a floating-point number. For example, an interval of 100 microseconds would be 0.1.</p>	0..1**
<code>sampleRate</code>	<p><b>DEPRECATED</b> in <i>MTConnect Version 1.2</i>. Replaced by <code>sampleInterval</code>.</p>	0..1***
<code>iso841Class</code>	<p><b>DEPRECATED</b> in <i>MTConnect Version 1.1</i>.</p>	0..1***

Attribute	Description	Occurrence
uuid	<p>A unique identifier for this XML element.</p> <p>uuid is a required attribute.</p> <p>The <b>uuid</b> <b>MUST</b> be unique amongst all <b>uuid</b> identifiers used in an MTConnect installation.</p> <p>For example, this may be a combination of the manufacturer's code and serial number. The <b>uuid</b> <b>SHOULD</b> be alphanumeric and not exceed 255 characters.</p> <p>An NMTOKEN XML type.</p>	1*
name	<p>The name of the piece of equipment represented by the <b>Device</b> element.</p> <p>name is a required attribute.</p> <p>This name <b>MUST</b> be unique for each <b>Device</b> XML element defined in the <b>MTConnectDevices</b> document.</p> <p>An NMTOKEN XML type.</p>	1

194

195 Notes: \* A **uuid** **MUST** be provided for each **Device** element. It is optional for all other  
 196 Structural Elements.

197        \*\* The sampleInterval is used to aid a client software application in interpreting values  
 198        provided by some Data Entities. This is the desired sample interval and may vary  
 199        depending on the capabilities of the piece of equipment.

200        \*\*\* Remains in schema for backwards compatibility.

201

202 **4.2.3 Elements for Device**

203 The following table lists the elements defined to provide additional information for a `Device`  
 204 element. These elements are organized in the `Device` container.

Element	Description	Occurrence
Description	An XML element that can contain any descriptive content.	0..1
Configuration	An XML element that contains technical information about a piece of equipment describing its physical layout or functional characteristics.	0..1
DataItems	A container for the <i>Data Entities</i> (See <i>Section 7 and 8</i> of this document for more details) provided by this <code>Device</code> element.	1 *
Components	A container for the <code>Component</code> elements associated with this <code>Device</code> element.	0..1
Compositions	A container for the <code>Composition</code> elements associated with this <code>Device</code> element.	0..1
References	A container for the <code>Reference</code> elements associated with this <code>Device</code> element.	0..1

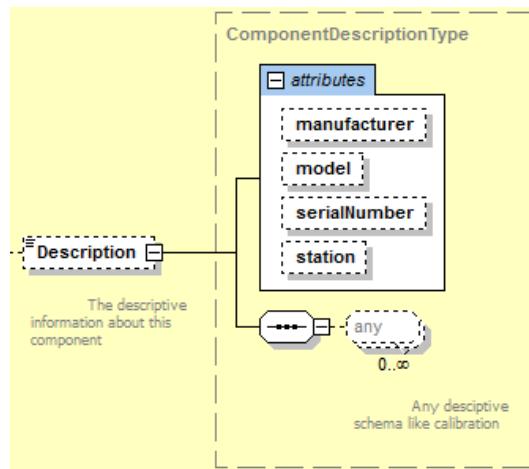

205

206 Note: \* DataItems **MUST** be provided since every piece of equipment **MUST** report  
 207 AVAILABILITY.

208

209 **4.2.3.1 Description for Device**

210 The following XML schema represents the structure of the `Description` XML element  
 211 showing the attributes defined for `Description`. `Description` can contain any  
 212 descriptive content for this piece of equipment. This element is defined to contain mixed content  
 213 and additional XML elements (indicated by the `any` element in the schema below) **MAY** be  
 214 added to extend the schema for `Description`.

215

216 **Figure 4: Description Schema Diagram**

217

218

219 The following table lists the attributes defined for the `Description` XML element.

Attribute	Description	Occurrence
<code>manufacturer</code>	The name of the manufacturer of the piece of equipment represented by the <code>Device</code> element. <code>manufacturer</code> is an optional attribute.	0..1
<code>model</code>	The model description of the piece of equipment represented by the <code>Device</code> element. <code>model</code> is an optional attribute.	0..1
<code>serialNumber</code>	The serial number associated with piece of equipment represented by the <code>Device</code> element. <code>serialNumber</code> is an optional attribute.	0..1
<code>station</code>	The station where the equipment represented by the <code>Device</code> element is located when it is part of a manufacturing unit or cell with multiple stations. <code>station</code> is an optional attribute.	0..1

220

221 The content of `Description` **MAY** include any additional descriptive information the  
222 implementer chooses to include regarding a piece of equipment. This content **SHOULD** be  
223 limited to information not included elsewhere in the `MTConnectDevices` XML document.

224 An example of a `Description` is as follows:

225   1. `<Description manufacturer="Example Co" serialNumber="A124FFF"`  
226   2.   `station="2">` Example Co Simulated Vertical 3 Axis Machining center.  
227   3. `</Description>`

#### 228 **4.2.3.2 Configuration for Device**

229 The `Configuration` XML element contains technical information about a piece of  
230 equipment. `Configuration` **MAY** include any information describing the physical layout or  
231 functional characteristics of the piece of equipment, such as capabilities, testing, installation,  
232 operation, calibration, or maintenance.

233

234 Not all types of equipment support Configuration. When Configuration is supported,  
 235 details on the schema for Configuration will be included in the applicable sections of the  
 236 MTConnect Standard.

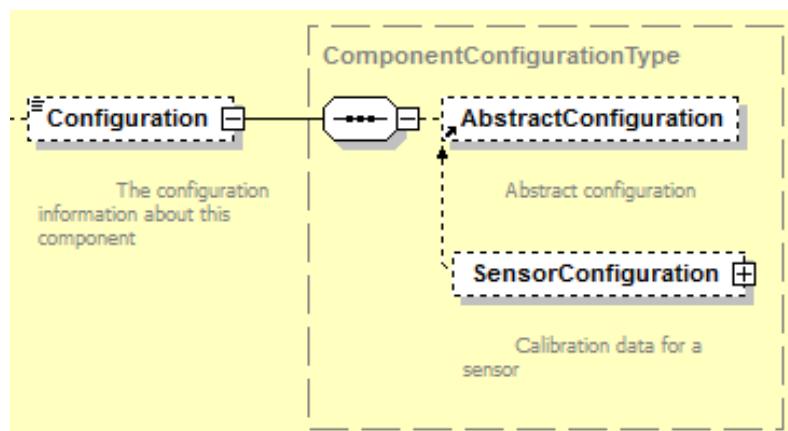

237

Element	Description	Occurrence
Configuration	An XML element that contains technical information about a piece of equipment describing its physical layout or functional characteristics.	0..1

238

239 Configuration data for Device is structured in the MTConnectDevices XML document as  
 240 shown below. AbstractConfiguration is an abstract type XML element. It will never  
 241 appear in the XML document representing a piece of equipment. When Configuration is  
 242 supported for a type of equipment, that configuration will appear in the XML document.  
 243 Currently, Sensor is the only type of equipment that supports Configuration.  
 244 SensorConfiguration is described in detail in *Section 9.4*.

245

246

247 **Figure 5: Configuration Schema Diagram**

248

#### 249 **4.2.3.3 DataItems for Device**

250 DataItems is an XML container that provides structure for organizing the data reported by a  
 251 piece of equipment that is associated with the Device element.

252 DataItems **MUST** be provided since every piece of equipment **MUST** report the data item  
 253 AVAILABILITY.

254 See *Sections 7 and 8* of this document for details on the DataItems XML element.

255 **4.2.3.4 Components within Device**

256 The use of the XML container Components within a Device element provides the ability to  
 257 break down the structure of a Device element into *Top Level* and *Lower Level* physical and  
 258 logical sub-parts. If a Components XML element is provided, then only one Components  
 259 element **MUST** be defined for a Device element.

260 **4.2.3.5 Compositions for Device**

261 Compositions is an XML container used to organize Composition elements associated  
 262 with a Device element. See *Section 4.5* for details on Compositions.

263 **4.2.3.6 References for Device**

264 References is an XML container used to organize Reference elements associated with a  
 265 Device element. See *Section 4.7* for details on References.

266 **4.3 Components**

267 Components is an XML container used to group information describing physical parts or  
 268 logical functions of a piece of equipment. Components contains one or more Component  
 269 XML elements.

Element	Description	Occurrence
Components	<p>XML container that consists of one or more types of Component XML elements.</p> <p>If a Components XML element is provided, then only one Components element <b>MUST</b> be defined for a Device element.</p>	0..1

270

271

## 272 **4 . 4 Component**

273 A Component XML element is a container type XML element used to organize information  
 274 describing a physical part or logical function of a piece of equipment. It also provides structure  
 275 for describing the *Lower Level Structural Elements* associated with the Component.  
 276 Component is an abstract type XML element and will never appear directly in the MTConnect  
 277 XML document. As an abstract type XML element, Component will be replaced in the XML  
 278 document by specific Component types. XML elements representing Component are  
 279 described in *Section 5* and include elements such as Axes, Controller, and Systems.

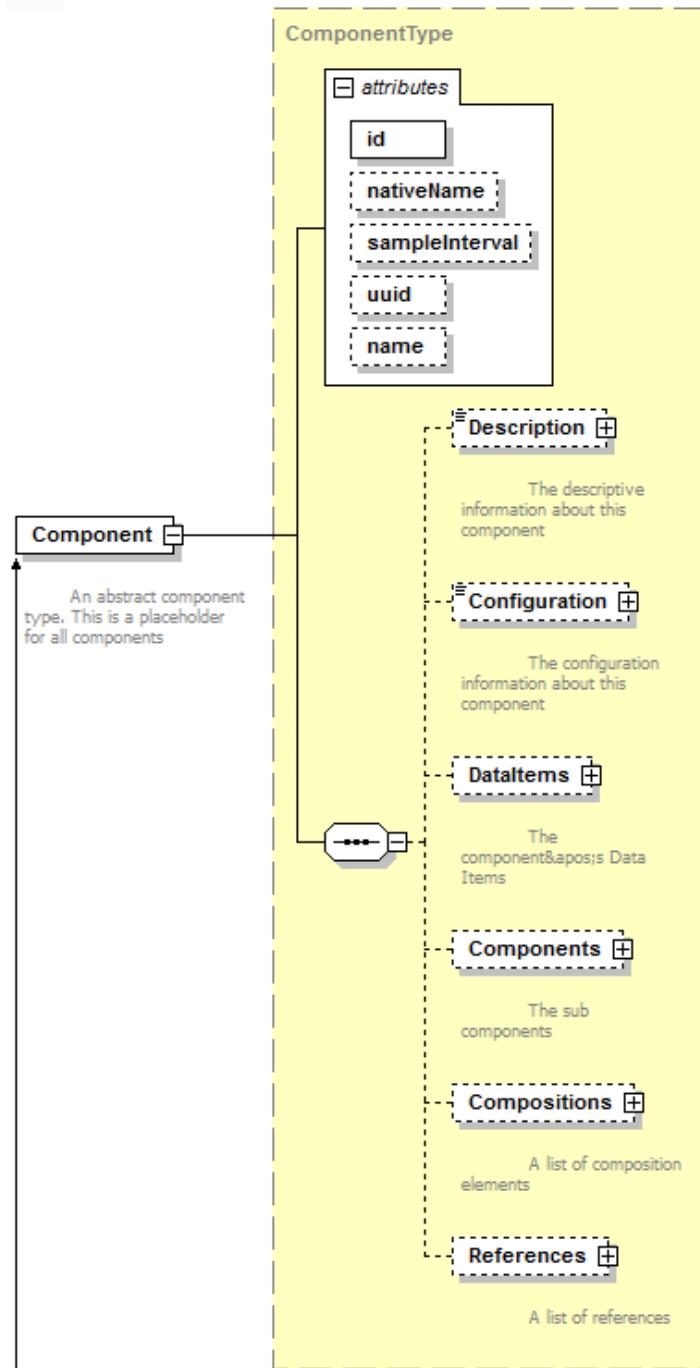

Element	Description	Occurrence
Component	An abstract XML element. Replaced in the XML document by types of Component elements representing physical parts and logical functions of a piece of equipment.  There can be multiple types of Component XML elements in the document.	1..INF

280

281

282    **4.4.1 XML Schema Structure for Component**

283    The following XML schema represents the structure of a Component XML element showing  
 284    the attributes defined for Component and the elements that **MAY** be associated with  
 285    Component.

286

287

**Figure 6: Component Schema**

288    **4.4.2 Attributes for Component**

289    The following table defines the attributes that may be used to provide additional information for  
 290    a Component type XML element.

291

Attribute	Description	Occurrence
<code>id</code>	<p>The unique identifier for this XML element.  <code>id</code> is a required attribute.        An <code>id</code> <b>MUST</b> be unique across all the <code>id</code> attributes in the document.        An XML ID-type.</p>	1
<code>nativeName</code>	<p>The common name normally associated with a specific physical or logical part of a piece of equipment.  <code>nativeName</code> is an optional attribute.</p>	0..1
<code>sampleInterval</code>	<p>An optional attribute that is an indication provided by a piece of equipment describing the interval in milliseconds between the completion of the reading of the data associated with the <code>Component</code> element until the beginning of the next sampling of that data. This indication is reported as the number of milliseconds between data captures.        This information may be used by client software applications to understand how often information from a piece of equipment for a specific <code>Component</code> element is expected to be refreshed.        The refresh rate for data from all <i>Lower Level</i> <code>Component</code> elements will be the same as for the parent <code>Component</code> element unless specifically overridden by another <code>sampleInterval</code> provided for the <i>Lower Level</i> <code>Component</code> element.        If the value of <code>sampleInterval</code> is less than one millisecond, the value will be represented as a floating-point number. For example, an interval of 100 microseconds would be 0.1.</p>	0..1**
<code>sampleRate</code>	<p><b>DEPRECATED</b> in <i>MTConnect Version 1.2</i>. Replaced by <code>sampleInterval</code>.</p>	0..1***
<code>uuid</code>	<p>A unique identifier for this XML element.  <code>uuid</code> is an optional attribute.        The <code>uuid</code> <b>MUST</b> be unique amongst all <code>uuid</code> identifiers used in an MTConnect installation.        For example, this may be a combination of the manufacturer's code and serial number. The <code>uuid</code> <b>SHOULD</b> be alphanumeric and not exceed 255 characters.        An NMTOKEN XML type.</p>	0..1*

Attribute	Description	Occurrence
name	<p>The name of the Component element.</p> <p>name is an optional attribute.</p> <p>However, if there are multiple <i>Lower Level</i> components that have the same parent and are of the same component type (example Linear), then the name attribute <b>MUST</b> be provided for all <i>Lower Level</i> components of the same element type to differentiate between the similar components.</p> <p>When provided, name <b>MUST</b> be unique for all <i>Lower Level</i> components of a parent Component.</p> <p>An NMOKEN XML type.</p>	0..1

292

293 Notes: \* While `uuid` **MUST** be provided for the Device element, it is optional for  
 294 Component elements.

295       \*\* The sampleInterval is used to aid a client software application in interpreting values  
 296       provided by some *Data Entities*. This is the desired sample interval and may vary  
 297       depending on the capabilities of the piece of equipment.

298       \*\*\*Remains in schema for backwards compatibility.

#### 299 **4.4.3 Elements of Component**

300 The following table lists the elements defined to provide additional information for a  
 301 Component type XML element.

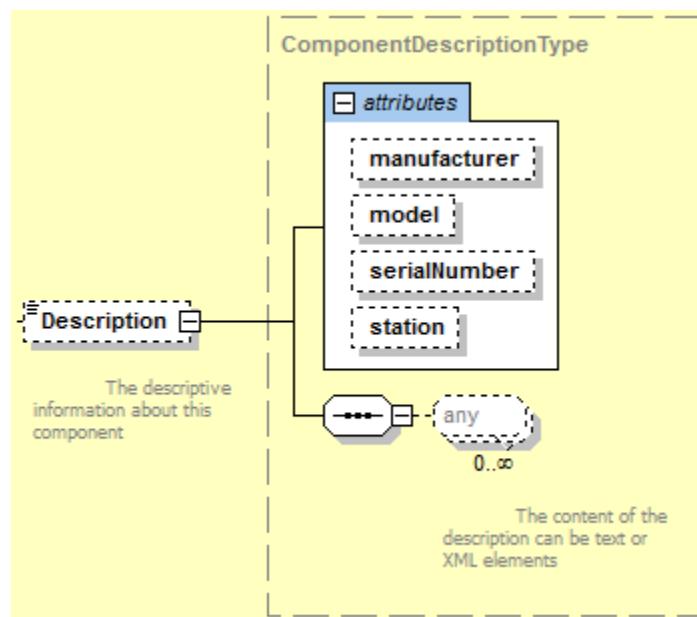

Element	Description	Occurrence
Description	An element that can contain any descriptive content.	0..1
Configuration	An XML element that contains technical information about a component describing its physical layout or functional characteristics.	0..1
DataItems	A container for the <i>Data Entities</i> (defined in <i>Section 8</i> ) associated with this Component element.	0..1*
Components	A container for <i>Lower Level</i> Component XML elements associated with this parent Component.	0..1*
Compositions	A container for the Composition elements (defined in <i>Section 6</i> ) associated with this Component element.	0..1
References	A container for the Reference elements associated with this Component element.	0..1*

302

303 Notes: \*At least one of Components, DataItems, or References **MUST** be provided.

304 **4.4.3.1 Description for Component**

305 The following XML schema represents the structure of the Description XML element  
 306 showing the attributes defined for Description. Description can contain any  
 307 descriptive content of this Component. This element is defined to contain mixed content and  
 308 additional XML elements (indicated by the any element in the schema below) **MAY** be added to  
 309 extend the schema for Description.

310

311 **Figure 7: Schema for Description of Component**

312

313

314 The following table lists the attributes defined for the `Description` XML element.

315

Attribute	Description	Occurrence
<code>manufacturer</code>	The name of the manufacturer of the physical or logical part of a piece of equipment represented by the <code>Component</code> element. <code>manufacturer</code> is an optional attribute.	0..1
<code>model</code>	The model description of the physical part or logical function of a piece of equipment represented by the <code>Component</code> element. <code>model</code> is an optional attribute.	0..1
<code>serialNumber</code>	The serial number associated with the physical part or logical function of a piece of equipment represented by the <code>Component</code> element. <code>serialNumber</code> is an optional attribute.	0..1
<code>station</code>	The station where the physical part or logical function of a piece of equipment represented by the <code>Component</code> element is located when it is part of a manufacturing unit or cell with multiple stations. <code>station</code> is an optional attribute.	0..1

316

317 The content of `Description` **MAY** include any additional descriptive information the  
318 implementer chooses to include regarding the `Component` element. This content **SHOULD** be  
319 limited to information not included elsewhere in the `MTConnectDevices` XML document.

320 An example of a `Description` element is as follows:

321 1. <`Description` `manufacturer`="Example Co"  
322 2.     `serialNumber`="EXCO-TT-099PP-XXXX"> Advanced Pulse watt-hour transducer  
323 3.     with pulse output  
324 4. </`Description`>

#### 325 4.4.3.2 Configuration for Component

326 The `Configuration` XML element contains technical information about a component.  
327 Configuration **MAY** include any information describing the physical layout or functional  
328 characteristics of a component, such as capabilities, testing, installation, operation, calibration, or  
329 maintenance.

330

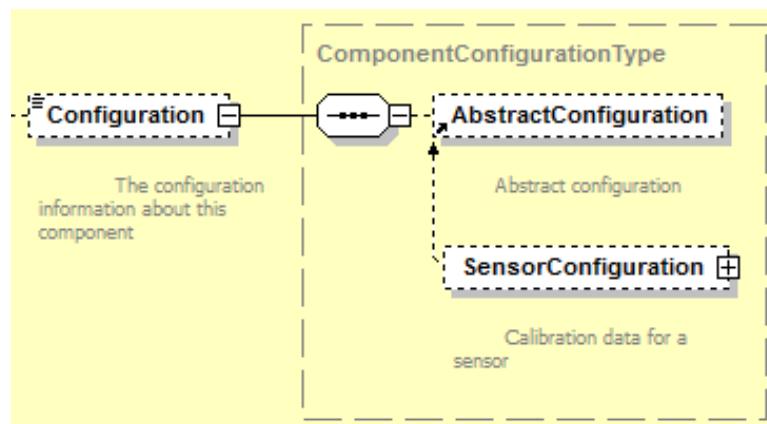

331 Not all Component types support Configuration. When Configuration is supported,  
 332 details on the schema for Configuration will be included in the applicable sections of the  
 333 MTConnect Standard.

334

Element	Description	Occurrence
Configuration	An XML element that contains technical information about a component describing its physical layout or functional characteristics.	0..1

335

336 Configuration data for Component is structured in the MTConnectDevices XML document  
 337 as shown below. AbstractConfiguration is an abstract type XML element. It will  
 338 never appear in the XML document for a device. When Configuration is supported for a  
 339 Component type, that configuration will appear in the XML document. Currently, Sensor is  
 340 the only component type that supports Configuration. SensorConfiguration is  
 341 described in detail in *Section 9.4*.

342

**Figure 8: Component Configuration Schema**

#### 344 **4.4.3.3 DataItems for Component**

345 DataItems is an XML container that provides structure for organizing the data reported by a  
 346 piece of equipment that is associated with the Component.

347 See *Section 7* of this document for details on the DataItems XML element.

#### 348 **4.4.3.4 Components within Component**

349 The use of the XML container Components within a Component element provides the ability  
 350 to further break down the structure of a Component element into even *Lower Level* physical  
 351 and logical sub-parts. These *Lower Level* elements can add more clarity and granularity to the  
 352 physical or logical structure of a piece of equipment and the data associated with that equipment.

353 This parent-child relationship can be extended down to any level necessary to fully describe a  
 354 piece of equipment. These *Lower Level* Component elements use the same XML structure as  
 355 Component defined in *Section 4.4.1* of this document.

356 A parent Component and the *Child Elements* are represented in a XML document as follows:

```
357 1. <Devices>
358 2.   <Device>
359 3.     <Components>
360 4.       <Axes> (Component)
361 5.         <Components>
362 6.           <Linear> (Component)
363 7.             <Components>
364 8.               <Etc. > (Component)
```

#### 365 **4.4.3.5 Compositions for Component**

366 Compositions is an XML container used to organize the lowest level structural building  
 367 blocks contained within a Component as defined below.

#### 368 **4.4.3.6 References for Component**

369 References is an XML container used to organize Reference elements associated with a  
 370 Component element. See *Section 4.7* for details on References.

### 371 **4.5 Compositions**

372 Compositions is an XML container that defines the lowest level structural building blocks  
 373 contained within a Component element.

374 Compositions contains one or more Composition XML elements.

Element	Description	Occurrence
Compositions	XML Container consisting of one or more types of Composition XML elements. Only one Compositions container <b>MAY</b> appear for a Component element.	0..1

375

### 376 **4.6 Composition**

377 Composition XML elements are used to describe the lowest level physical building blocks of  
 378 a piece of equipment contained within a Component.

379 Like Component elements, Composition elements provide the ability to organize  
 380 information describing *Lower Level* sub-parts of a higher-level Component element. However,  
 381 unlike Component, Composition **MUST NOT** be further sub-divided and *Data Entities*  
 382 **MUST NOT** be assigned to Composition elements.

383 Composition elements are used to add more clarity and granularity to the data being retrieved  
 384 from a piece of equipment. The meaning of the data associated with a Component may be  
 385 enhanced by designating a specific Composition element associated with that data.

386 An example of the additional detail provided when using Composition elements would be:

387 A TEMPERATURE associated with a Linear type axis may be further clarified by  
 388 referencing the MOTOR or AMPLIFIER type Composition element associated with that  
 389 axis, which differentiates the temperature of the motor from the temperature of the amplifier.

390 Composition is a typed XML element and will always define a specific type of structural  
 391 building block contained within a Component. XML elements representing the types of  
 392 Composition elements are described in *Section 6* of this document and include elements  
 393 describing such basic building blocks as motors, amplifiers, filters, and pumps.

394 A parent Component and child Composition elements are represented in an XML document  
 395 as follows:

```
396 1. <Devices>
397 2.   <Device>
398 3.     <Components>
399 4.       <Axes> (Component)
400 5.       <Components>
401 6.         <Linear> (Component)
402 7.         <Compositions>
403 8.           <Composition>
404 9.           <Composition>
405 10.          <Composition>
```

406

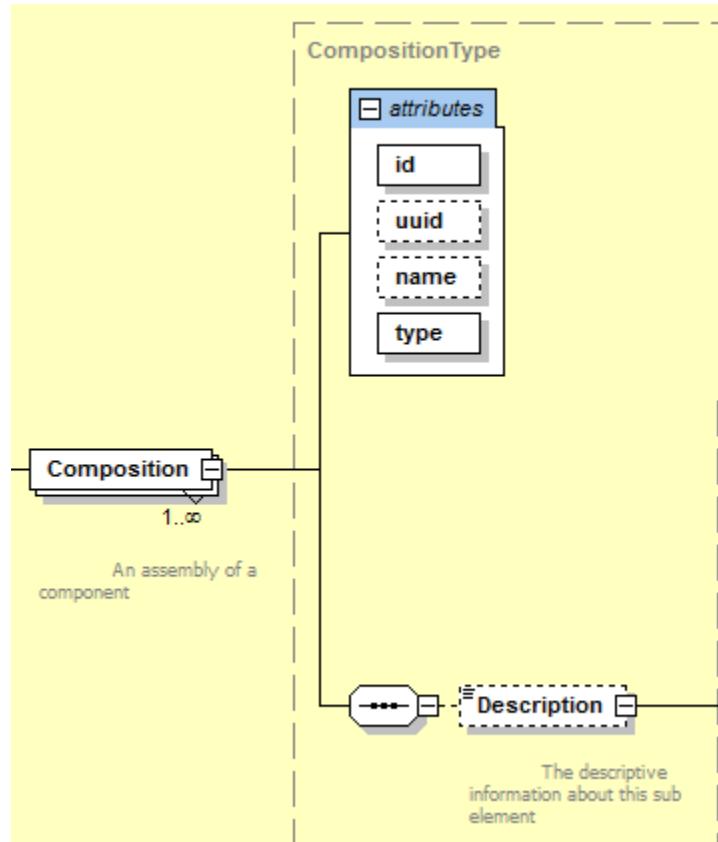

Element	Description	Occurrence
Composition	An XML element used to describe the lowest level structural building blocks contained within a Component element.  Composition is a typed XML element.  There can be multiple types of Composition XML elements defined for a Component element.	1..INF

407

408

409 **4.6.1 XML Schema Structure for Composition**

410 The following XML schema represents the structure of a Composition XML element  
411 showing the attributes defined for Composition and the elements that may be associated with  
412 Composition type XML elements.

413

414

**Figure 9: Composition Schema**

415

416

## 417 4.6.2 Attributes for Composition

418 The following table defines the attributes that may be used to provide additional information for  
 419 a Composition type XML element.

420

Attribute	Description	Occurrence
id	<p>The unique identifier for this XML element.  <code>id</code> is a required attribute.            An <code>id</code> <b>MUST</b> be unique across all the <code>id</code> attributes in the document.            An XML ID-type.</p>	1
uuid	<p>A unique identifier for this XML element.  <code>uuid</code> is an optional attribute.            The <code>uuid</code> <b>MUST</b> be unique amongst all <code>uuid</code> identifiers used in an MTConnect installation.            For example, this may be a combination of the manufacturer's code and serial number. The <code>uuid</code> <b>SHOULD</b> be alphanumeric and not exceed 255 characters.            An NMTOKEN XML type.</p>	0..1
name	<p>The name of the Composition element.  <code>name</code> is an optional attribute.            If provided, <code>name</code> <b>MUST</b> be unique within a Component element.            An NMTOKEN XML type.</p>	0..1
type	<p>The type of Composition element.  <code>type</code> is a required attribute.            Examples of types are MOTOR, FILTER, PUMP, and AMPLIFIER.            Refer to <i>Section 6</i> for a list of currently defined types.</p>	1

421

422

423 **4.6.3 Elements of Composition**

424 The following table lists the elements defined to provide additional information for a  
 425 Composition type XML element.

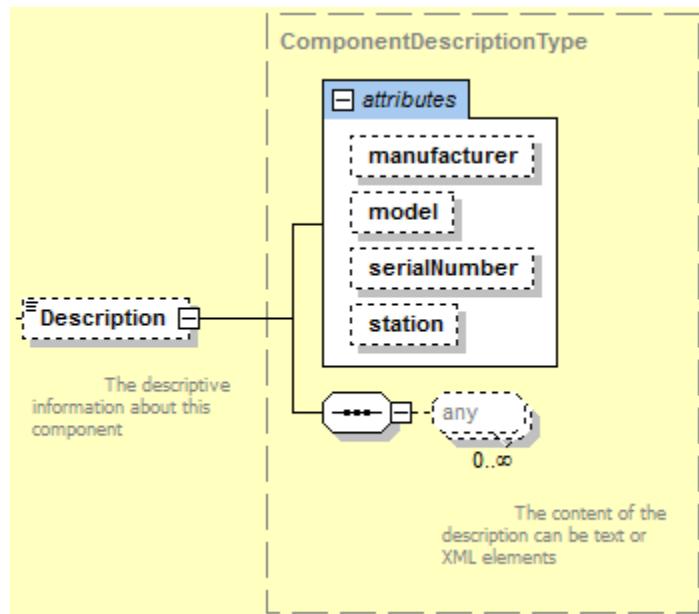

426

Element	Description	Occurrence
Description	An element that can contain any descriptive content.	0..1

427

428 **4.6.3.1 Description for Composition**

429 The following XML schema represents the structure of the Description XML element  
 430 showing the attributes defined for Description. Description can contain any  
 431 descriptive content for this Composition element. This element is defined to contain mixed  
 432 content and additional XML elements (indicated by the any element in the schema below) **MAY**  
 433 be added to extend the schema for Description.

434

435 **Figure 10: Schema for Description of Composition**

436

437

438 The following table lists the attributes defined for the **Description** XML element.

439

Attribute	Description	Occurrence
manufacturer	The name of the manufacturer of the physical part of a piece of equipment represented by the <b>Composition</b> element.  manufacturer is an optional attribute.	0..1
model	The model description of the physical part of a piece of equipment represented by the <b>Composition</b> element.  model is an optional attribute.	0..1
serialNumber	The serial number associated with the physical part of a piece of equipment represented by the <b>Composition</b> element.  serialNumber is an optional attribute.	0..1
station	The station where the physical part of a piece of equipment represented by the <b>Composition</b> element is located when it is part of a manufacturing unit or cell with multiple stations.  station is an optional attribute.	0..1

440

441 The content of **Description** **MAY** include any additional descriptive information the  
442 implementer chooses to include regarding the **Composition** element. This content **SHOULD**  
443 be limited to information not included elsewhere in the **MTConnectDevices** XML document.

444 An example of a **Description** element is as follows:

445 11. <Description manufacturer="Example Co" serialNumber="A124FFF"  
446 12. station="2"> Spindle motor associated with Path 2.  
447 13. </Description>

## 448 4.7 References

449 **References** is an XML container that organizes pointers to information defined elsewhere  
450 within the XML document for a piece of equipment.

451 **References** may be modeled as part of a **Device**, **Component** or **Interface** type  
452 *Structural Element*.

453

454 References contains one or more Reference XML elements.

Element	Description	Occurrence
References	XML Container consisting of one or more types of Reference XML elements. Only one References container <b>MUST</b> appear for a Device, Component, or Interface element.	0..1

455

## 456 4.8 Reference

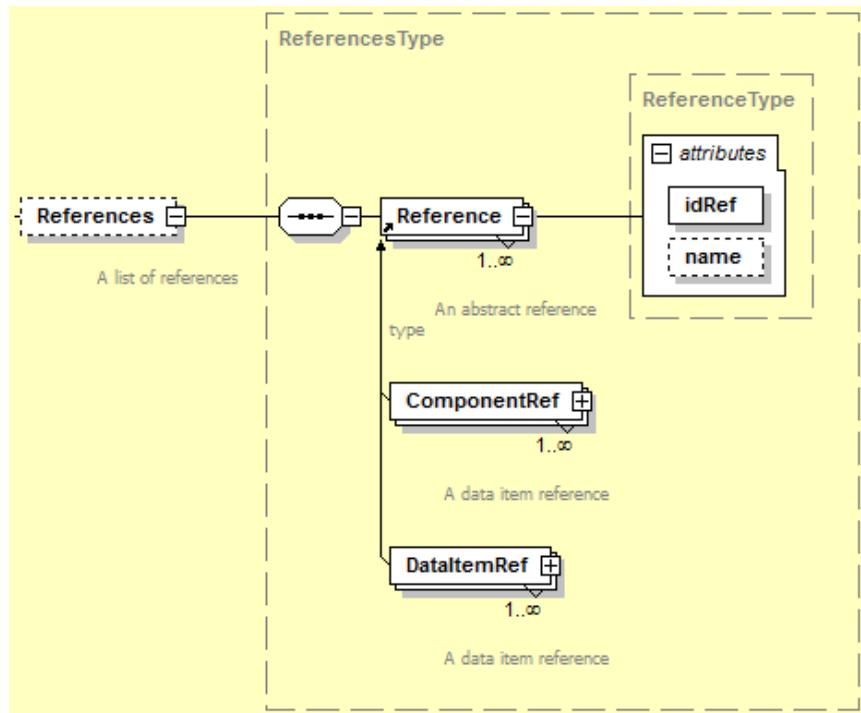

457 Reference is a pointer to information that is associated with another *Structural Element*  
 458 defined elsewhere in the XML document for a piece of equipment. That information may be  
 459 data from the other element or the entire structure of that element.

460 Reference is an efficient method to associate information with an element without duplicating  
 461 any of the data or structure. For example, a Bar Feeder System may make a request for the  
 462 BarFeederInterface and receive all the relevant data for the interface and the associated  
 463 spindle (ROTARY element) that is referenced as part of the BarFeederInterface.

464 Reference is an abstract type XML element and will never appear directly in the MTConnect  
 465 XML document. As an abstract type XML element, Reference will be replaced in the XML  
 466 document by a specific Reference type. The current supported types of Reference are  
 467 DataItemRef and ComponentRef XML elements.

468

469 The following XML schema represents the structure of the Reference XML element.

470

471

**Figure 11: Reference Schema Diagram**

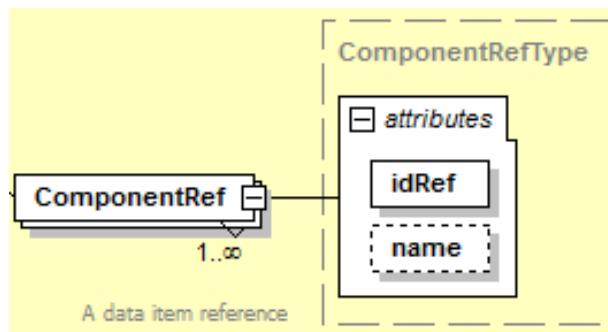

#### 4.8.1 ComponentRef

473 ComponentRef XML element is a pointer to all of the information associated with another  
 474 *Structural Element* defined elsewhere in the XML document for a piece of equipment.  
 475 ComponentRef allows all of the information (*Lower Level Components* and all *Data Entities*) that is associated with the other *Structural Element* to be directly associated with this  
 476 XML element.

477

478 The following XML schema represents the structure of a ComponentRef XML element  
 479 showing the attributes defined for ComponentRef.

480

481

482

**Figure 12: ComponentRef Schema Diagram**

483 The following table lists the attributes defined for the ComponentRef element.

484

Attribute	Description	Occurrence
idRef	A pointer to the id attribute of the Component that contains the information to be associated with this XML element.  idRef is a required attribute.	1
name	The name of the ComponentRef element.  name is an optional attribute.  However, if there are multiple ComponentRef elements defined for a component, the name attribute <b>MUST</b> be provided for all ComponentRef elements to differentiate between the similar elements.  When provided, name <b>MUST</b> be unique for all ComponentRef elements associated with the <i>Parent Element</i> .  An NMTOKEN XML type.	0..1

485

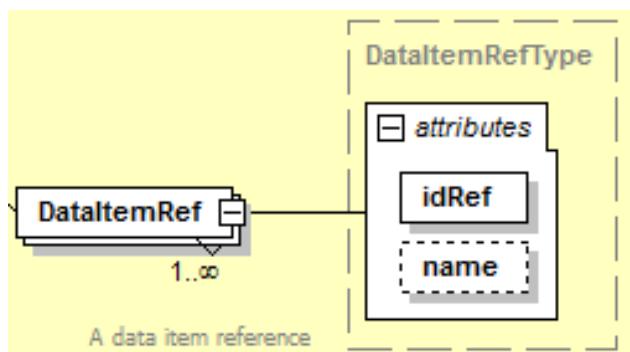

486

#### 4.8.2 DataItemRef

488 DataItemRef XML element is a pointer to a *Data Entity* associated with another *Structural Element* defined elsewhere in the XML document for a piece of equipment. DataItemRef allows the data associated with a data item defined in another *Structural Element* to be directly associated with this XML element.

492 The following XML schema represents the structure of a DataItemRef XML element showing the attributes defined for DataItemRef.

494

495

496 **Figure 13: DataItemRef Schema Diagram**

497 The following table lists the attributes defined for the DataItemRef element.

498

Attribute	Description	Occurrence
idRef	A pointer to the id attribute of the DataItem that contains the information to be associated with this XML element.  idRef is a required attribute.	1
name	The name of the DataItemRef element.  name is an optional attribute.  However, if there are multiple DataItemRef elements defined for a component, the name attribute <b>MUST</b> be provided for all DataItemRef elements to differentiate between the similar elements.  When provided, name <b>MUST</b> be unique for all DataItemRef elements associated with the <i>Parent Element</i> .  An NMTOKEN XML type.	0..1

499

## 500 5 Component Structural Elements

501 Component *Structural Elements* are XML containers used to represent physical parts or logical  
 502 functions of a piece of equipment.

503 Component *Structural Elements* are defined into two major categories:

- 504 • *Top Level* Component elements are used to group the *Structural Elements* representing  
 505 the most significant physical or logical functions of a piece of equipment. The *Top Level*  
 506 Component elements provided in an MTConnectDevices document **SHOULD** be  
 507 restricted to those defined in the table below. However, these *Top Level* Component  
 508 elements **MAY** also be used as *Lower Level* Component elements; as required.
- 509 • *Lower Level* Component elements are used to describe the sub-parts of the parent  
 510 Component to provide more clarity and granularity to the physical or logical structure  
 511 of the *Top Level* Component elements.

512 This section (*Section 5*) of the *Devices Information Model* provides guidance for the most  
 513 common relationships between *Top Level* Component elements and *Lower Level* child  
 514 components. However, all Component elements **MAY** be used in any configuration, as  
 515 required, to fully describe a piece of equipment.

516 As described in *Section 4* above, Component is an abstract type *Structural Element* within the  
 517 *Devices Information Model* and will never appear directly in the MTConnectDevices XML  
 518 document. As abstract type XML elements, Component will be replaced in the XML document  
 519 by a specific Component type defined below.

520 The following table defines the *Top Level* Component elements available to describe a piece of  
 521 equipment.

522

<i>Top Level Component Element</i> **	Description
Axes	An XML container used to organize the <i>Structural Elements</i> of a piece of equipment that perform linear or rotational motion.
Controller	An XML container used to organize information about an intelligent or computational function within a piece of equipment.
Systems	An XML container used to organize information for <i>Lower Level</i> elements representing the major sub-systems that are permanently integrated into a piece of equipment.
Auxiliaries	An XML container used to organize information for <i>Lower Level</i> elements representing functional sub-systems that provide supplementary or extended capabilities for a piece of equipment, but they are not required for the basic operation of the equipment.

<b><i>Top Level Component Element **</i></b>	<b>Description</b>
Resources	An XML container used to organize information for <i>Lower Level</i> elements representing types of items, materials, and personnel that support the operation of a piece of equipment or work to be performed at a location. Resources also represents materials or other items consumed or transformed by a piece of equipment for production of parts or other types of goods.
Interfaces	An XML container that organizes information used to coordinate actions and activities between pieces of equipment that communicate information between each other.

523

524     \*\* Note: The following components have been relocated or redefined since they are not  
 525       classified as restricted *Top Level* components:

526       - Power was **DEPRECATED** in *MTConnect Version 1.1* and was replaced by the  
 527       *Data Entity* called AVAILABILITY.

528       - Door has been redefined as a *Lower Level* component of a parent Component  
 529       element or as a Composition element.

530       - Actuator, due to its uniqueness, has been redefined as a piece of equipment with  
 531       the ability to be represented as a *Lower Level* component of a parent Component  
 532       element or as a Composition element.

533       - Sensor, due to its uniqueness, has been redefined as a piece of equipment with the  
 534       ability to be represented as a *Lower Level* component of a parent Component element  
 535       (See *Section 9* for further detail).

536       - Stock has been redefined as a *Lower Level* component of the Resources *Top*  
 537       *Level* Component element.

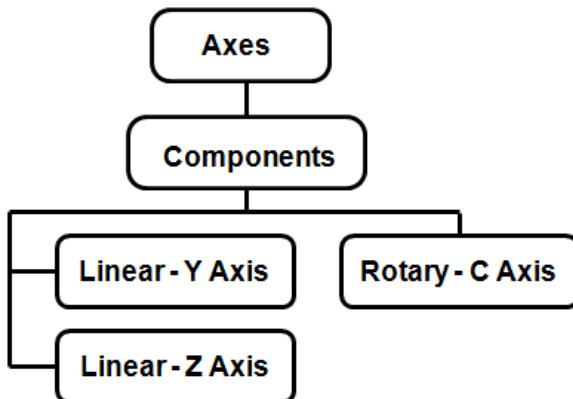

538     The common relationship between the *Top Level* Component elements and the *Lower Level*  
 539     child Component elements are described below. It should be noted that as the MTConnect  
 540     Standard evolves, more Component types will be added to organize information for new types  
 541     of equipment and/or new physical or logical sub-parts of equipment.

## 542     **5.1 Axes**

543     Axes is a *Top Level* Component element. It is a container that organizes information  
 544     representing the *Structural Elements* that perform linear or rotational motion for a piece of  
 545     equipment.

546     Axes organizes information for the individual physical axes into Component types of Linear  
 547     and Rotary based on the type of motion performed by each axis. Axes **MUST** contain at least  
 548     one Linear or one Rotary type axis.

549 The following diagram defines the relationship between the `Axes` container and the individual  
 550 axis type *Structural Elements*.

551

552 **Figure 14: Axes Example with Two Linear Axes and One Rotary Axis**

553

### 554 **5.1.1 Linear**

555 A Linear axis represents the movement of a physical piece of equipment, or a portion of the  
 556 equipment, in a straight line.

557 Movement may be either in a positive or negative direction.

558 Linear type axes **MUST** be identified using a value for the `name` attribute as X, Y, or Z with  
 559 numbers appended for additional axes in the same plane. Additional linear axes are often  
 560 referred to as U, V, and W. However, MTConnect defines the secondary axes to X, Y, and Z as  
 561 X2, Y2, and Z2.

562 If the piece of equipment is unable to provide information associated with the `name` attribute,  
 563 then the `nativeName` attribute **MUST** be included to identify the axis.

### 564 **5.1.2 Rotary**

565 A Rotary axis represents any non-linear or rotary movement of a physical piece of equipment  
 566 or a portion of the equipment.

567 Rotary type axes **MUST** be identified using a value for the `name` attribute as A, B, and C for  
 568 axes that rotate around the X, Y, and Z axes respectively. As with the Linear axes, a number  
 569 **MUST** be appended for additional axes in the same plane (C, C2, C3, C4, ...).

570 If the piece of equipment is unable to provide information associated with the `name` attribute,  
 571 then the `nativeName` attribute **MUST** be included to identify the axis.

572 An axis whose function is to provide rotary motion may function as a continuous rotation  
 573 (SPINDLE mode), continuous-path contour rotary motion (CONTOUR mode), or positioning  
 574 (INDEX mode) to discrete rotary positions. As such, a Rotary type axis **SHOULD** specify a  
 575 ROTARY\_MODE data item identifying the operating mode of the axis: SPINDLE, INDEX, or  
 576 CONTOUR.

### 577 **5.1.2.1 Chuck**

578 Chuck is an XML container that provides the information about a mechanism that holds a part  
 579 or stock material in place. It may also represent the information about any other type  
 580 mechanism that holds items in place within a piece of equipment.

581 The operation of a Chuck when represented as a Component element is defined by  
 582 CHUCK\_STATE. The value of CHUCK\_STATE **MAY** be OPEN, CLOSED, or UNLATCHED.

583 Chuck may be used in the MTConnectDevices document as either a *Lower Level*  
 584 component or as a Composition element of a parent Component element.

## 585 **5.2 Controller**

586 Controller is a *Top Level* container that organizes information for an intelligent part of a  
 587 piece of equipment that monitors and calculates information to alter the operating conditions of  
 588 the equipment. Typical types of controllers for a piece of equipment include CNC (Computer  
 589 Numerical Control), PAC (Programmable Automation Control), IPC (Industrialized Computer),  
 590 or IC (Imbedded Computer).

591 Controller provides information regarding the execution of a control program(s), the mode  
 592 of operation of the piece of equipment, and fault information regarding the operation of the  
 593 equipment.

594 Note: *MTConnect Version 1.1.0* and later implementations **SHOULD** use a *Lower Level*  
 595 Component element called Path to represent an individual tool path or other  
 596 independent function within a Controller element. When the Controller  
 597 element is capable of executing more than one simultaneous and independent  
 598 programs, the implementation **MUST** specify a *Lower Level* Path element  
 599 representing each of the independent functions of the Controller.

### 600 **5.2.1 Path**

601 Path is an XML container that represents the information for an independent operation or  
 602 function within a Controller. For many types of equipment, Path represents a set of Axes,  
 603 one or more Program elements, and the data associated with the motion of a control point as it  
 604 moves through space. However, it **MAY** also represent any independent function within a  
 605 Controller that has unique data associated with that function.

606 Path **SHOULD** provide an EXECUTION data item to define the operational state of the  
 607 Controller component of the piece of equipment.

608 If the Controller is capable of performing more than one independent operation or function  
609 simultaneously, a separate Path component **MUST** be used to organize the data associated with  
610 each independent operation or function.

## 611 **5 . 3 Systems**

612 Systems is a *Top Level* XML container that provides structure for the information describing  
613 one or more *Lower Level* functional systems that perform as discrete operating modules of the  
614 equipment or provide utility type services to support the operation of the equipment. These  
615 systems are required for the piece of equipment to perform its intended function and are  
616 permanently integrated into the piece of equipment.

617 Since these systems operate as separate functional units, they are represented in the  
618 MTConnectDevices XML document as individual *Lower Level* Component elements of  
619 Systems based on the function or service provided.

### 620 **5.3.1 Hydraulic System**

621 Hydraulic is an XML container that represents the information for a system comprised of all  
622 the parts involved in moving and distributing pressurized liquid throughout the piece of  
623 equipment.

### 624 **5.3.2 Pneumatic System**

625 Pneumatic is an XML container that represents the information for a system comprised of all  
626 the parts involved in moving and distributing pressurized gas throughout the piece of equipment.

### 627 **5.3.3 Coolant System**

628 Coolant is an XML container that represents the information for a system comprised of all the  
629 parts involved in distribution and management of fluids that remove heat from a piece of  
630 equipment.

### 631 **5.3.4 Lubrication System**

632 Lubrication is an XML container that represents the information for a system comprised of  
633 all the parts involved in distribution and management of fluids used to lubricate portions of the  
634 piece of equipment.

### 635 **5.3.5 Electric System**

636 Electric is an XML container that represents the information for the main power supply for  
637 device piece of equipment and the distribution of that power throughout the equipment. The  
638 electric system will provide all the data with regard to electric current, voltage, frequency, etc.  
639 that applies to the piece of equipment as a functional unit. Data regarding electric power that is  
640 specific to a Component will be reported as *Data Entities* for that specific Component.

### 641 **5.3.6 Enclosure System**

642 Enclosure is an XML container that represents the information for a structure used to contain  
643 or isolate a piece of equipment or area. The Enclosure system may provide information  
644 regarding access to the internal components of a piece of equipment or the conditions within the  
645 enclosure. For example, Door may be defined as a *Lower Level Component* or  
646 Composition element of the Enclosure system.

### 647 **5.3.7 Protective System**

648 Protective is an XML container that represents the information for those functions that  
649 detect or prevent harm or damage to equipment or personnel. Protective does not include  
650 the information relating to the Enclosure system.

### 651 **5.3.8 ProcessPower System**

652 ProcessPower is an XML container that represents the information for a power source  
653 associated with a piece of equipment that supplies energy to the manufacturing process separate  
654 from the Electric system. For example, this could be the power source for an EDM  
655 machining process, an electroplating line, or a welding system.

### 656 **5.3.9 Feeder System**

657 Feeder is an XML container that represents the information for a system that manages the  
658 delivery of materials within a piece of equipment. For example, this could describe the wire  
659 delivery system for an EDM or welding process; conveying system or pump and valve system  
660 distributing material to a blending station; or a fuel delivery system feeding a furnace.

### 661 **5.3.10 Dielectric System**

662 Dielectric is an XML container that represents the information for a system that manages a  
663 chemical mixture used in a manufacturing process being performed at that piece of equipment.  
664 For example, this could describe the dielectric system for an EDM process or the chemical bath  
665 used in a plating process.

## 666 **5.4 Auxiliaries**

667 Auxiliaries is a *Top Level* XML container that provides structure for the information  
668 describing one or more *Lower Level* functional systems that provide supplementary or additional  
669 capabilities for the operation of a piece of equipment. These systems extend the capabilities of a  
670 piece of equipment, but are not required for the equipment to function.

671 Since these systems operate as independent units or are only temporarily associated with a piece  
672 of equipment, they are represented in the MTConnectDevices XML document as individual  
673 *Lower Level Component* elements of Auxiliaries based on the function or service  
674 provided to the equipment.

675 **5.4.1 Loader System**

676 Loader is an XML container that represents the information for a unit comprised of all the parts  
677 involved in moving and distributing materials, parts, tooling, and other items to or from a piece  
678 of equipment.

679 **5.4.2 WasteDisposal System**

680 WasteDisposal is an XML container that represents the information for a unit comprised of  
681 all the parts involved in removing manufacturing byproducts from a piece of equipment.

682 **5.4.3 ToolingDelivery System**

683 ToolingDelivery is an XML container that represents the information for a unit involved in  
684 managing, positioning, storing, and delivering tooling within a piece of equipment.

685 **5.4.4 BarFeeder System**

686 BarFeeder is an XML container that represents the information for a unit involved in  
687 delivering bar stock to a piece of equipment.

688 **5.4.5 Environmental System**

689 Environmental is an XML container that represents the information for a unit or function  
690 involved in monitoring, managing, or conditioning the environment around or within a piece of  
691 equipment.

692 **5.4.6 Sensor System**

693 Sensor is a XML container that represents the information for a piece of equipment that  
694 responds to a physical stimulus and transmits a resulting impulse or value from a sensing unit.  
695 When modeled as a component of Auxiliaries, sensor **SHOULD** represent an integrated  
696 *sensor unit* system that provides signal processing, conversion, and communications. A *sensor*  
697 *unit* may have multiple *sensing elements*; each representing the data for a variety of measured  
698 values. See *Section 9.2* for more details on *sensor unit*.

699 Note: If modeling an individual sensor, then *sensor* should be associated with the  
700 component that the measured value is most closely associated. See *Section 5.7.3*.

701 **5.5 Resources**

702 Resources is a *Top Level* XML container that groups items that support the operation of a  
703 piece of equipment. Resources also represents materials or other items consumed,  
704 transformed, or used for production of parts, materials, or other types of goods by a piece of  
705 equipment.

## 706 **5.5.1 Materials**

707 Materials is an XML container that provides information about materials or other items  
708 consumed or used by the piece of equipment for production of parts, materials, or other types of  
709 goods. Materials also represents parts or part stock that are present at a piece of equipment  
710 or location to which work is applied to transform the part or stock material into a more finished  
711 state.

### 712 **5.5.1.1 Stock**

713 Stock is an XML container that represents the information for the material that is used in a  
714 manufacturing process and to which work is applied in a machine or piece of equipment to  
715 produce parts.

716 Stock may be either a continuous piece of material from which multiple parts may be produced  
717 or it may be a discrete piece of material that will be made into a part or a set of parts.

## 718 **5.5.2 Personnel**

719 Personnel is an XML container that provides information about an individual or individuals  
720 who either control, support, or otherwise interface with a piece of equipment.

## 721 **5.6 Interfaces**

722 Interfaces is a *Top Level XML Structural Element* in the MTConnectDevices XML  
723 document. Interfaces organizes the information provided by a piece of equipment used to  
724 coordinate activities with other pieces of equipment. As such, Interfaces represents the  
725 inter-device communication information between a piece of equipment and other pieces of  
726 equipment.

727 See Part 5.0 – *Interfaces* of the MTConnect Standard for detailed information on Interfaces.

## 728 **5.7 Other Components**

729 While most component elements **SHOULD** be modeled in a specific manner, there are some  
730 types of component elements that are used ubiquitously in equipment and **MAY** be associated  
731 with any number of different types of *parent* component elements.

732 These components **MAY** be modeled as *Lower Level* components of the *Parent Element*.

### 733 **5.7.1 Actuator**

734 Actuator is an XML container that represents the information for an apparatus for moving or  
735 controlling a mechanism or system. It takes energy usually provided by air, electric current, or  
736 liquid and converts the energy into some kind of motion.

737 **5.7.2 Door**

738 `Door` is an XML container that represents the information for a mechanical mechanism or  
739 closure that can cover, for example, a physical access portal into a piece of equipment. The  
740 closure can be opened or closed to allow or restrict access to other parts of the equipment.

741 When `Door` is represented as a Component, it **MUST** have a data item called `DOOR_STATE`  
742 to indicate if the door is OPEN, CLOSED, or UNLATCHED. A Component **MAY** contain  
743 multiple `Door` components.

744 **5.7.3 Sensor**

745 `Sensor` is a XML container that represents the information for a piece of equipment that  
746 responds to a physical stimulus and transmits a resulting impulse or value. If modeling  
747 individual sensors, then `sensor` should be associated with the component that the measured  
748 value is most closely associated.

749

750 See *Section 9* for more details on the use of `Sensor`.

## 751 6 Composition Type Structural Elements

752 Composition *Structural Elements* are used to describe the lowest level physical building  
 753 blocks of a piece of equipment contained within a Component. By referencing a specific  
 754 Composition element, further clarification and meaning to data associated with a specific  
 755 Component can be achieved.

756 Both Component and Composition elements are *Lower Level* child Component XML  
 757 elements representing the sub-parts of the parent Component. However, there are distinct  
 758 differences between Component and Composition type elements.

759 Component elements may be further defined with *Lower Level* Component elements and may  
 760 have associated *Data Entities*.

761 Composition elements represent the lowest level physical part of a piece of equipment. They  
 762 **MUST NOT** be further defined with *Lower Level* Component elements and they **MUST NOT**  
 763 have *Data Entities* directly associated with them. They do provide additional information that  
 764 can be used to enhance the specificity of *Data Entities* associated with the parent Component.

765 The following table defines Composition type elements that are currently available to  
 766 describe sub-parts of a Component element.

767

Element Type	Description
ACTUATOR	<p>A mechanism for moving or controlling a mechanical part of a piece of equipment.            It takes energy usually provided by air, electric current, or liquid and converts the energy into some kind of motion.</p>
AMPLIFIER	<p>An electronic component or circuit for amplifying power, electric current, or voltage.</p>
BALLSCREW	<p>A mechanical structure for transforming rotary motion into linear motion.</p>
BELT	<p>An endless flexible band used to transmit motion for a piece of equipment or to convey materials and objects.</p>
BRAKE	<p>A mechanism for slowing or stopping a moving object by the absorption or transfer of the energy of momentum, usually by means of friction, electrical force, or magnetic force.</p>
CHOPPER	<p>A mechanism used to break material into smaller pieces.</p>
CIRCUIT_BREAKER	<p>A mechanism for interrupting an electric circuit.</p>

Element Type	Description
CHAIN	An interconnected series of objects that band together and are used to transmit motion for a piece of equipment or to convey materials and objects.
CHUCK	A mechanism that holds a part, stock material, or any other item in place.
CHUTE	An inclined channel for conveying material.
CLAMP	A mechanism used to strengthen, support, or fasten objects in place.
COMPRESSOR	A pump or other mechanism for reducing volume and increasing pressure of gases in order to condense the gases to drive pneumatically powered pieces of equipment.
DOOR	A mechanical mechanism or closure that can cover a physical access portal into a piece of equipment allowing or restricting access to other parts of the equipment.
DRAIN	A mechanism that allows material to flow for the purpose of drainage from, for example, a vessel or tank.
ENCODER	A mechanism used to measure rotary position.
FAN	Any mechanism for producing a current of air.
FILTER	Any substance or structure through which liquids or gases are passed to remove suspended impurities or to recover solids.
GRIPPER	A mechanism that holds a part, stock material, or any other item in place.
HOPPER	A chamber or bin in which materials are stored temporarily, typically being filled through the top and dispensed through the bottom.
MOTOR	A mechanism that converts electrical, pneumatic, or hydraulic energy into mechanical energy.
OIL	A viscous liquid.
PUMP	An apparatus raising, driving, exhausting, or compressing fluids or gases by means of a piston, plunger, or set of rotating vanes.
LINEAR_POSITION_FEEDBACK	A mechanism that measures linear motion or position.
POWER_SUPPLY	A unit that provides power to electric mechanisms.
PULLEY	A mechanism or wheel that turns in a frame or block and serves to change the direction of or to transmit force.

Element Type	Description
SENSING_ELEMENT	A mechanism that provides a signal or measured value.
STORAGE_BATTERY	A component consisting of one or more cells, in which chemical energy is converted into electricity and used as a source of power.
SWITCH	A mechanism for turning on or off an electric current or for making or breaking a circuit.
TANK	A receptacle or container for holding material.
TENSIONER	A mechanism that provides or applies a stretch or strain to another mechanism.
TRANSFORMER	A mechanism that transforms electric energy from a source to a secondary circuit.
VALVE	Any mechanism for halting or controlling the flow of a liquid, gas, or other material through a passage, pipe, inlet, or outlet.
WATER	A fluid.
WIRE	A string like piece or filament of relatively rigid or flexible material provided in a variety of diameters.

768

769

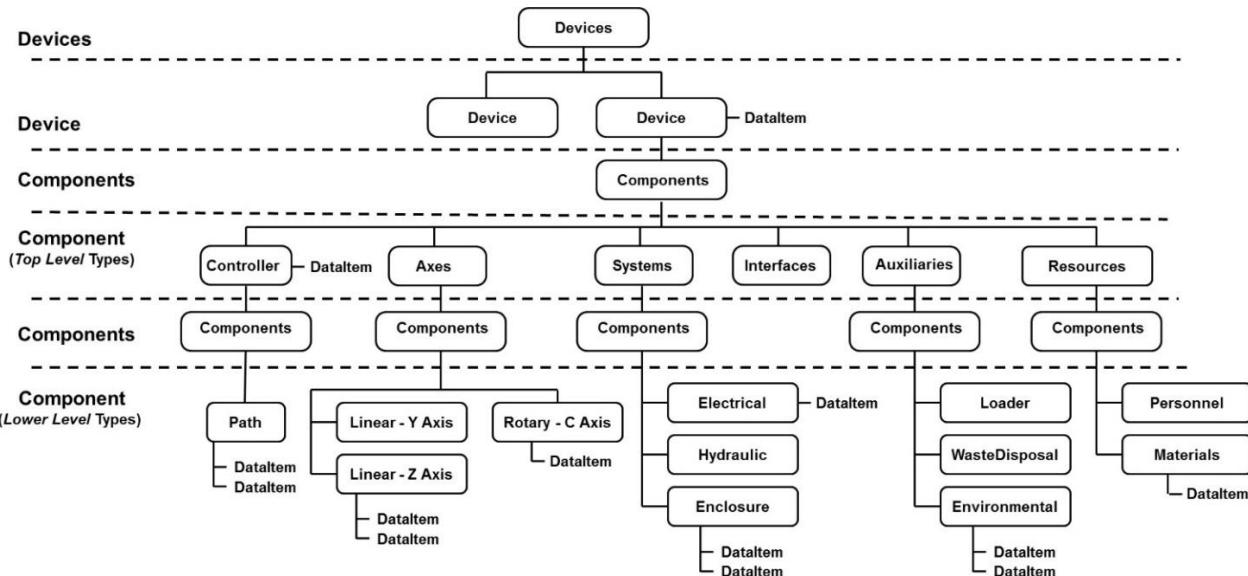

Note: As the MTConnect Standard evolves, more Composition types will be added.

## 770    7 Data Entities for Device

- 771    In the MTConnectDevices XML document, *Data Entities* are XML elements that describe  
772    data that can be reported by a piece of equipment and are associated with *Device* and  
773    *Component Structural Elements*. While the *Data Entities* describe the data that can be  
774    reported by a piece of equipment in the MTConnectDevices document, the actual data values  
775    are provided in the *Streams Information Model*. See *Part 3.0 – Streams Information Model* for  
776    the details on the reported values.
- 777    Each *Data Entity* **SHOULD** be modeled in the MTConnectDevices document such that it is  
778    associated with the *Structural Element* that the reported data directly applies.
- 779    When *Data Entities* are associated with a *Structural Element*, they are organized in a  
780    *DataItems* XML element. *DataItems* is a container type XML element. *DataItems*  
781    provides the structure for organizing individual *DataItem* elements that represent each *Data*  
782    *Entity*. The *DataItems* container is comprised of one or more *DataItem* type XML  
783    element(s).
- 784    *DataItem* describes specific types of *Data Entities* that represent a numeric value, a  
785    functioning state, or a health status reported by a piece of equipment. *DataItem* provides a  
786    detailed description for each *Data Entity* that is reported; it defines the type of data being  
787    reported and an array of optional attributes that further describes that data. The different types  
788    of *DataItem* elements are defined in *Section 8*.

789 The following XML Tree demonstrates the relationship between *Data Entities* (`DataItem`) and  
 790 the various *Structural Elements* in the MTConnectDevices XML document.

791

792

**Figure 15: Example *Data Entities* for `Device` (`DataItem`)**

## 7.1 DataItems

795 The `DataItems` XML element is the first, or highest, level container for the *Data Entities*  
 796 associated with a `Device` or `Component` XML element. `DataItems` **MUST** contain only  
 797 `DataItem` type elements. `DataItems` **MUST** contain at least one `DataItem` type element,  
 798 but **MAY** contain multiple `DataItem` type elements.

Element	Description	Occurrence
<code>DataItems</code>	XML Container consisting of one or more types of <code>DataItem</code> XML elements.  Only one <code>DataItems</code> container <b>MUST</b> appear for each <i>Structural Element</i> in the XML document.	0..1

799

800 **7.2 DataItem**

801 A **DataItem** XML element represents each *Data Entity* that **MAY** be reported by a piece of  
 802 equipment through a *MTConnect Agent*. **DataItem** provides a detailed description for each  
 803 *Data Entity* that is reported and defines the type of data being reported along with an array of  
 804 optional attributes that further define that data. XML elements representing **DataItem** will  
 805 include elements such as TEMPERATURE, PRESSURE, and VELOCITY.

Element	Description	Occurrence
DataItem	<i>Data Entity</i> describing a piece of information reported about a piece of equipment.	1..INF

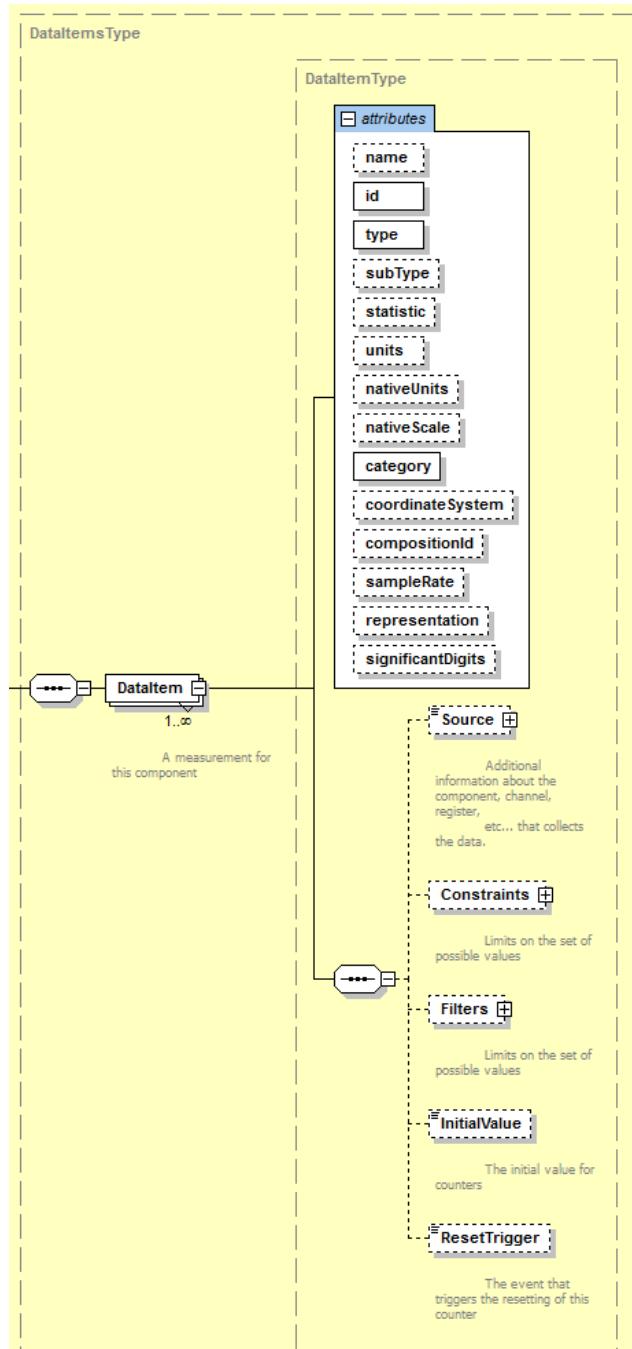

806

807

808 **7.2.1 XML Schema Structure for DataItem**

809 The following XML schema represents the structure of a DataItem XML element showing the  
 810 attributes defined for DataItem and the elements that may be associated with DataItem type  
 811 XML elements.

812

813

814

**Figure 16: DataItem Schema Diagram**

## 815 7.2.2 Attributes for DataItem

816 The following table lists the attributes defined to provide information for a DataItem type  
 817 XML element.

818 DataItem **MUST** specify the type of data being reported, the id of the DataItem, and the  
 819 category of the DataItem.

820

Attribute	Description	Occurrence
name	<p>The name of the data item.        name is provided as an additional human readable identifier for this data item in addition to the id.        name is an optional attribute and will be implementation dependent.        An NMOKEN XML type.</p>	0..1
id	<p>The unique identifier for this data item.        id is a required attribute.        The id attribute <b>MUST</b> be unique within the MTConnectDevices document.        An XML ID-type.</p>	1
type	<p>The type of data being measured.        type is a required attribute.        Examples of types are POSITION, VELOCITY, ANGLE, BLOCK, and ROTARY_VELOCITY.</p>	1
subType	<p>A sub-categorization of the data item type.        subType is an optional attribute.        For example, the subType of POSITION can be ACTUAL or        COMMANDED.        Not all type attributes have a subType.</p>	0..1
statistic	<p>Describes the type of statistical calculation performed on a series of data samples to provide the reported data value.        statistic is an optional attribute.        Examples of statistic are AVERAGE, MINIMUM, MAXIMUM, ROOT_MEAN_SQUARE, RANGE, MEDIAN, MODE, and STANDARD_DEVIATION.</p>	0..1

Attribute	Description	Occurrence
units	<p>The unit of measurement for the reported value of the data item.</p> <p>units is an optional attribute.</p> <p>Data items in the Sample category <b>MUST</b> report the standard units for the measured values.</p> <p>See <i>Section 7.2.2.7</i> for a list of available standard units identified in the MTConnect Standard.</p>	0..1
nativeUnits	<p>The native units of measurement for the reported value of the data item.</p> <p>nativeUnits is an optional attribute.</p> <p>See <i>Section 7.2.2.8</i> for a list of available native units identified in the MTConnect Standard</p>	0..1
nativeScale	<p>The nativeUnits may not be scaled to directly represent the original measured value. nativeScale <b>MAY</b> be used to convert the reported value to represent the original measured value.</p> <p>nativeScale is an optional attribute.</p> <p>As an example, the nativeUnits may be reported as GALLON/MINUTE. The measured value may actually be in 1000 GALLON/MINTUE. The value of the reported data <b>MAY</b> be divided by the nativeScale to convert the reported value to its original measured value and units.</p> <p>If provided, the value <b>MUST</b> be numeric.</p>	0..1
category	<p>Specifies the kind of information provided by a data item.</p> <p>category is a required attribute.</p> <p>The available options are SAMPLE, EVENT, or CONDITION.</p>	1
coordinateSystem	<p>For measured values relative to a coordinate system like POSITION, the coordinate system being used may be reported.</p> <p>coordinateSystem is an optional attribute.</p> <p>The available values for coordinateSystem are WORK and MACHINE.</p>	0..1
compositionId	<p>The identifier attribute of the Composition element that the reported data is most closely associated.</p> <p>compositionID is an optional attribute.</p>	0..1

Attribute	Description	Occurrence
sampleRate	<p>The rate at which successive samples of a data item are recorded by a piece of equipment.</p> <p>sampleRate is an optional attribute.</p> <p>sampleRate is expressed in terms of samples per second.</p> <p>If the sampleRate is smaller than one, the number can be represented as a floating point number. For example, a rate 1 per 10 seconds would be 0.1</p>	0..1**
representation	<p>Description of a means to interpret data consisting of multiple data points or samples reported as a single value.</p> <p>representation is an optional attribute.</p> <p>representation will define a unique format for each set of data.</p> <p>representation for TIME_SERIES, DISCRETE, and VALUE are defined below in <i>Section 7.2.2.12</i>.</p> <p>If representation is not specified, it <b>MUST</b> be determined to be VALUE.</p>	0..1
significantDigits	<p>The number of significant digits in the reported value.</p> <p>significantDigits is an optional attribute.</p> <p>This <b>SHOULD</b> be specified for all numeric values.</p>	0..1

821

822 **7.2.2.1 name Attribute for DataItem**

823 The attribute name is provided as an additional human readable identifier for a data item. It is  
 824 not required and is implementation dependent.

825 **7.2.2.2 id Attribute for DataItem**

826 Each DataItem element **MUST** be identified with an id. The id attribute **MUST** be unique  
 827 across the entire MTConnectDevices document for a piece of equipment, including the  
 828 identifiers for all *Structural Elements*. This unique id provides the information required by a  
 829 client software application to uniquely identify each *Data Entity*.

830 For example, an XML document may provide three different *Data Entities* representing the  
 831 position of the axes on a machine (x axis position, y axis position, and z axis position). All three  
 832 may be modeled in the XML document as Position type data items for the Axes  
 833 components. The unique id allows the client software application to distinguish the data for  
 834 each of the axes.

835 **7.2.2.3 type and subType Attributes for DataItem**

836 The attribute type specifies the kind of data that is represented by the data item.

- 837 The attribute `type` **MUST** be specified for every data item.
- 838 A data item **MAY** further qualify the data being reported by specifying a `subType`. `subType`  
839 is required for certain data item types. For example, `POSITION` has the `subType` of  
840 `ACTUAL` and `PROGRAMMED`. Both data values can be represented in the document as two  
841 separate and different `DataItem` XML elements – `POSITION` with `subType ACTUAL` and  
842 `POSITION` with `subType PROGRAMMED`.
- 843 The `type` and `subType` **SHOULD** be used to further identify the meaning of the `DataItem`  
844 associated with a `Component` element when a `subType` is applicable. There **SHOULD NOT**  
845 be more than one `DataItem` with the same `type`, `subType`, and `compositionId` within a  
846 `Component` element.
- 847 *Section 8* of this document provides a detailed listing of the data item `type` and `subType`  
848 elements defined for each category of data item available for a piece of equipment: `SAMPLE`,  
849 `EVENT`, and `CONDITION`.
- 850 **7.2.2.4 statistic Attribute for DataItem**
- 851 A piece of equipment may further process some data types using a statistical calculation like  
852 average, mean, or square root. In this case, the `statistic` attribute **MAY** be used to indicate  
853 how the data was processed.
- 854 `statistic` may be defined for any `SAMPLE` type `DataItem`. All `statistic` data is  
855 reported in the standard units of the `DataItem`.
- 856 `statistic` data is always the result of a calculation using data that has been measured over a  
857 specified period of time.
- 858 The value of `statistic` may be periodically reset. When a piece of equipment reports a  
859 `DataItem` with a value that is a `statistic`, the information provided in the XML document  
860 for that *Data Entity* **MUST** include an additional attribute called `duration`. The attribute  
861 `duration` defines the period of time over which the `statistic` has been calculated. Refer  
862 to *Part 3.0 – Streams Information Model* of the MTConnect Standard for more information about  
863 `duration`.
- 864 The following are the `statistic` calculations that can be defined for a `DataItem`.
- 865

Statistic	Description
AVERAGE	Mathematical Average value calculated for the data item during the calculation period.
KURTOSIS	A measure of the “peakedness” of a probability distribution; i.e., the shape of the distribution curve.

Statistic	Description
MAXIMUM	Maximum or peak value recorded for the data item during the calculation period.
MEDIAN	The middle number of a series of numbers.
MINIMUM	Minimum value recorded for the data item during the calculation period.
MODE	The number in a series of numbers that occurs most often.
RANGE	Difference between the Maximum and Minimum value of a data item during the calculation period. Also represents Peak-to-Peak measurement in a waveform.
ROOT_MEAN_SQUARE	Mathematical Root Mean Square (RMS) value calculated for the data item during the calculation period.
STANDARD_DEVIATION	Statistical Standard Deviation value calculated for the data item during the calculation period.

866

867 **7.2.2.5 units Attribute for DataItem**868 The following table lists the units that are defined as the standard unit of measure for each type  
869 of DataItem. All SAMPLE type data items **MUST** report data values in standard units.

Units	Description
AMPERE	Amps
CELSIUS	Degrees Celsius
COUNT	A counted event
DECIBEL	Sound Level
DEGREE	Angle in degrees
DEGREE/SECOND	Angular degrees per second
DEGREE/SECOND^2	Angular acceleration in degrees per second squared
HERTZ	Frequency measured in cycles per second
JOULE	A measurement of energy.

Units	Description
KILOGRAM	Kilograms
LITER	Liters
LITER/SECOND	Liters per second
MICRO_RADIAN	Measurement of Tilt
MILLIMETER	Millimeters
MILLIMETER/SECOND	Millimeters per second
MILLIMETER/SECOND <sup>2</sup>	Acceleration in millimeters per second squared
MILLIMETER_3D	A point in space identified by X, Y, and Z positions and represented by a space-delimited set of numbers each expressed in millimeters.
NEWTON	Force in Newtons
NEWTON_METER	Torque, a unit for force times distance.
OHM	Measure of Electrical Resistance
PASCAL	Pressure in Newtons per square meter
PASCAL_SECOND	Measurement of Viscosity
PERCENT	Percentage
PH	A measure of the acidity or alkalinity of a solution
REVOLUTION/MINUTE	Revolutions per minute
SECOND	A measurement of time.
SIEMENS/METER	A measurement of Electrical Conductivity
VOLT	Volts
VOLT_AMPERE	Volt-Ampere (VA)
VOLT_AMPERE_REACTIVE	Volt-Ampere Reactive (VAR)
WATT	Watts
WATT_SECOND	Measurement of electrical energy, equal to one Joule

871    **7.2.2.6 nativeUnits Attribute for DataItem**

872    The `nativeUnits` attribute provides additional information about the original measured value  
 873    for a *Data Entity* reported by a piece of equipment. `nativeUnits` **MAY** be specified to  
 874    provide additional information about the data if the units of the measured value supplied by the  
 875    piece of equipment differ from the value provided for that data when converted to standard units.

876    The following table defines the `nativeUnits` currently supported by the  
 877    MTConnectDevices XML document:

878

Native Units	Description
CENTIPOISE	A measure of Viscosity
DEGREE/MINUTE	Rotational velocity in degrees per minute
FAHRENHEIT	Temperature in Fahrenheit
FOOT	Feet
FOOT/MINUTE	Feet per minute
FOOT/SECOND	Feet per second
FOOT/SECOND^2	Acceleration in feet per second squared
FOOT_3D	A point in space identified by X, Y, and Z positions and represented by a space-delimited set of numbers each expressed in feet.
GALLON/MINUTE	Gallons per minute.
INCH	Inches
INCH/MINUTE	Inches per minute
INCH/SECOND	Inches per second
INCH/SECOND^2	Acceleration in inches per second squared
INCH_3D	A point in space identified by X, Y, and Z positions and represented by a space-delimited set of numbers each expressed in inches.
INCH_POUND	A measure of torque in inch pounds.
KELVIN	A measurement of temperature
KILOWATT	A measurement in kilowatt.

Native Units	Description
KILOWATT_HOUR	Kilowatt hours which is 3.6 mega joules.
LITER	Measurement of volume of a fluid
LITER/MINUTE	Measurement of rate of flow of a fluid
MILLIMETER/MINUTE	Velocity in millimeters per minute
POUND	US pounds
POUND/INCH^2	Pressure in pounds per square inch (PSI).
RADIAN	Angle in radians
RADIAN/SECOND	Velocity in radians per second
RADIAN/SECOND^2	Rotational acceleration in radian per second squared
RADIAN/MINUTE	Velocity in radians per minute.
REVOLUTION/SECOND	Rotational velocity in revolution per second
OTHER	Unsupported units

879

880 **7.2.2.7 nativeScale Attribute for DataItem**

881 The units of measure for some measured values may be different from the nativeUnits  
 882 defined in *Section 7.2.2.8* above. In the cases where the units of measure use a different  
 883 weighting or range than is provided by nativeUnits, the nativeScale attribute can be  
 884 used to define the original units of measure.

885 As an example, a velocity measured in units of 100 ft/min can be represented as  
 886 nativeUnits="FEET/MINUTE" and nativeScale="100".

887 **7.2.2.8 category Attribute for DataItem**

888 Many DataItem types provide two forms of data, a value (reported as either a SAMPLE or  
 889 EVENT category) and a health status (reported as a CONDITION category). Therefore, each  
 890 occurrence of a DataItem in the XML document **MUST** report a category attribute. This  
 891 category attribute provides the information required by a client software application to  
 892 determine the specific meaning of the data provided.

893 Each *Data Entity* provided by a piece of equipment **MUST** be identified with one of the  
 894 following:

895	<b>SAMPLE</b>	A SAMPLE is the reading of the value of a continuously variable or analog data value. A continuous value can be measured at any point-in-time and will always produce a result. An example of a continuous data value is the position of the Linear X Axis.
896		
897		
898		
899		
900		The data provided for a SAMPLE category data item is always a floating point number or integers that have an infinite number of possible values. This is different from a state or discrete type data item that has a limited number of possible values. A data item of category SAMPLE <b>MUST</b> also provide the units attribute.
901		
902		
903		
904		
905	<b>EVENT</b>	An EVENT is a data item representing a discrete piece of information from the piece of equipment. EVENT does not have intermediate values that vary over time, as does SAMPLE. An EVENT is information that, when provided at any specific point in time, represents the current state of the piece of equipment.
906		
907		
908		
909		There are two types of EVENT: those representing state, with two or more discrete values, and those representing messages that contain plain text data.
910		
911		An example of a state type EVENT is the value of the data item DOOR_STATE, which can be OPEN, UNLATCHED, or CLOSED. (Note: No other values are valid to represent the value of DOOR_STATE.)
912		
913		
914		An example of a message type EVENT is the value for a data item PROGRAM. The value representing PROGRAM can be any valid string of characters.
915		
916	<b>CONDITION</b>	A CONDITION is a data item that communicates information about the health of a piece of equipment and its ability to function. A valid value for a data item in the category CONDITION can be one of NORMAL, WARNING, or FAULT .
917		
918		
919		
920		A data item of category CONDITION <b>MAY</b> report multiple values (CONDITION) at one time whereas a data item of category SAMPLE or EVENT can only have a single value at any one point in time.
921		
922		
923		
924	<b>7.2.2.9 coordinateSystem Attribute for DataItem</b>	
925		The values reported by a piece of equipment for some types of data will be associated to a specific positioning measurement system used by the equipment. The coordinateSystem attribute <b>MAY</b> be used to specify the coordinate system used for the measured value.
926		
927		
928		The coordinateSystem attribute is used by a client software application to interpret the spatial relationship between values reported by a piece of equipment.
929		

930 If coordinateSystem is not provided, all values representing positional data for Axes  
 931 **MUST** be interpreted using the MACHINE coordinate system and all values representing  
 932 positional data for Path **MUST** be interpreted using the WORK coordinate system.

933 The following table defines the types of coordinateSystem currently supported by the  
 934 MTConnectDevices XML document:

Coordinate System	Description
MACHINE	An unchangeable coordinate system that has machine zero as its origin.
WORK	The coordinate system that represents the working area for a particular workpiece whose origin is shifted within the MACHINE coordinate system. If the WORK coordinates are not currently defined in the piece of equipment, the MACHINE coordinates will be used.

935

#### 936 **7.2.2.10 compositionId Attribute for DataItem**

937 compositionId attribute identifies the id of the Composition element where the reported  
 938 data is most closely associated.

939 An example would be a TEMPERATURE associated with a Linear type axis may be further  
 940 clarified by referencing the MOTOR or AMPLIFIER type Composition element associated  
 941 with that axis, which differentiates the temperature of the motor from the temperature of the  
 942 amplifier.

943 The compositionId attribute provides the information required by a client software  
 944 application to interpret the data with a greater specificity and to disambiguate between multiple  
 945 *Data Entities* of the same data type associated with a Component element.

#### 946 **7.2.2.11 sampleRate Attribute for DataItem**

947 The value for some data types provided by a piece of equipment may be reported as a single set  
 948 of data containing a series of values that have been recorded at a fixed sample rate. When such  
 949 data is reported, the sampleRate defines the rate at which successive samples of data were  
 950 recorded.

951 The sampleRate attribute provides the information required by a client software application to  
 952 interpret the data and the sampling time relationship between successive values contained in the  
 953 set of data.

954 sampleRate is expressed in terms of samples per second. If the sample rate is smaller than  
 955 one, the number can be represented as a floating point number. For example, a rate 1 per 10  
 956 seconds would be 0.1

957    **7.2.2.12 representation Attribute for DataItem**

958    Some data types provide data that may consist of a series of values or a file of data, not a single  
 959    value. Other data types provide a series of data values that may require additional information so  
 960    that the data may be correctly understood by a client software application.

961    When such data is provided, the representation attribute **MUST** be used to define the  
 962    format for the data provided.

963    The types of representation defined are provided in the table below.

964    Note: See *Part 3.0 - Streams Information Model* of the MTConnect Standard for more  
 965    information on the structure and format of each representation.

966

Representation	Description
VALUE	<p>The measured value of the sampled data.</p> <p>If no representation is specified for a data item, the representation <b>MUST</b> be determined to be VALUE.</p>
TIME_SERIES	<p>A series of sampled data.</p> <p>The data is reported for a specified number of samples and each sample is reported with a fixed period.</p>
DISCRETE	<p>A <i>Data Entity</i> where each discrete occurrence of the data may have the same value as the previous occurrence of the data. There is no reported state change between occurrences of the data.</p> <p>In this case, duplicate occurrences of the same data value <b>SHOULD NOT</b> be suppressed.</p> <p>An example of a DISCRETE data type would be a parts counter that reports the completion of each part versus the accumulation of parts.</p> <p>Another example would be a Message that does not typically have a reset state and may re-occur each time a specific message is triggered.</p>

967

968    **7.2.2.13 significantDigits Attribute for DataItem**

969    significantDigits is used to specify the level of precision (number of significant digits)  
 970    for the value provided for a data item.

971    significantDigits attribute is not required for a data item, but it is recommended and  
 972    **SHOULD** be used for any data item reporting a numeric value.

973 **7.2.3 Elements for DataItem**

974 The following table lists the elements defined to provide additional information for a DataItem  
 975 type XML element.

Element	Description	Occurrence
Source	Source is an optional XML element that identifies the Component, DataItem, or Composition representing the part of the piece of equipment from which a measured value originates.	0..1
Constraints	Constraints is an optional container that provides a set of expected values that can be reported for this DataItem. Constraints are used by a software application to evaluate the validity of the reported data.	0..1
Filters	An optional container for the Filter elements associated with this DataItem element.	0..1
InitialValue	InitialValue is an optional XML element that defines the starting value for a data item as well as the value to be set for the data item after a reset event.  Only one InitialValue element may be defined for a data item. The value will be constant and cannot change.  If no InitialValue element is defined for a data item that is periodically reset, then the starting value for the data item <b>MUST</b> be a value of 0.	0..1
ResetTrigger	ResetTrigger is an optional XML element that identifies the type of event that may cause a reset to occur. It is additional information regarding the meaning of the data that establishes an understanding of the time frame that the data represents so that the data may be correctly understood by a client software application.	0..1

976

977 **7.2.3.1 Source Element for DataItem**

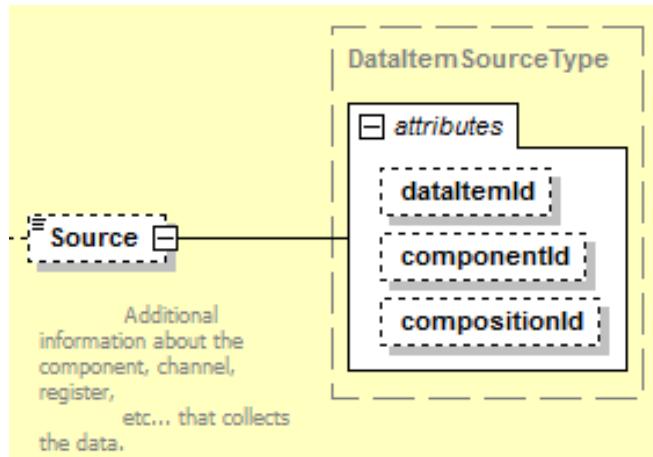

978 Source is an optional XML element that identifies the physical part of a piece of equipment  
 979 where the data represented by DataItem originated.

980 As an example, data related to a servo motor on an Axes component may actually originate  
 981 from a measurement made in the Controller element.

982 In the case where the real name associated with a DataItem element is either complex or does  
 983 not meet the format requirements of a NMTOKEN XML type, the real name of the element may  
 984 not be able to be expressed in the name attribute. When this occurs, a short name or nickname  
 985 can be used for the name attribute and the real name can be provided as the CDATA for  
 986 Source.

987

988 The following XML schema represents the structure of the Source XML element showing the  
989 attributes defined for Source.  
990

991

992

**Figure 17: Source Schema Diagram**

993

#### 994 **7.2.3.1.1 Attributes for Source**

995 The following table identifies the attributes available to identify Source for a measured value:

Attribute	Description	Occurrence
componentId	<p>The identifier attribute of the Component element that represents the physical part of a piece of equipment where the data represented by the DataItem element originated.</p> <p>A valid data value reported for componentId <b>MUST</b> be the value of the Id attribute for the Component element identified.</p> <p>componentId is an optional attribute.</p>	0..1*
dataItemId	<p>The identifier attribute of the DataItem that represents the originally measured value of the data referenced by this data item.</p> <p>A valid data value reported for dataItemId <b>MUST</b> be the value of the Id attribute for the DataItem element identified.</p> <p>dataItemId is an optional attribute.</p>	0..1*
compositionId	<p>The identifier attribute of the Composition element that represents the physical part of a piece of equipment where the data represented by the DataItem element originated.</p> <p>A valid data value reported for compositionId <b>MUST</b> be the value of the Id attribute for the Composition element identified.</p> <p>compositionId is an optional attribute.</p>	0..1*

996

997 Note: \* One of componentId, compositionId, or dataItemId **MUST** be provided.

998

999 **7.2.3.2 Constraints Element for DataItem**1000 For some types of DataItem elements, the expected value(s) for the data reported for the  
1001 DataItem **MAY** be restricted to specific values or a range of values.1002 Constraints is an optional XML element that provides a way to define the expected value(s)  
1003 or the upper and lower limits for the range of values that are expected to be reported in response  
1004 to a Current or Sample request.

1005 Constraints are used by a software application to evaluate the validity of the data reported.

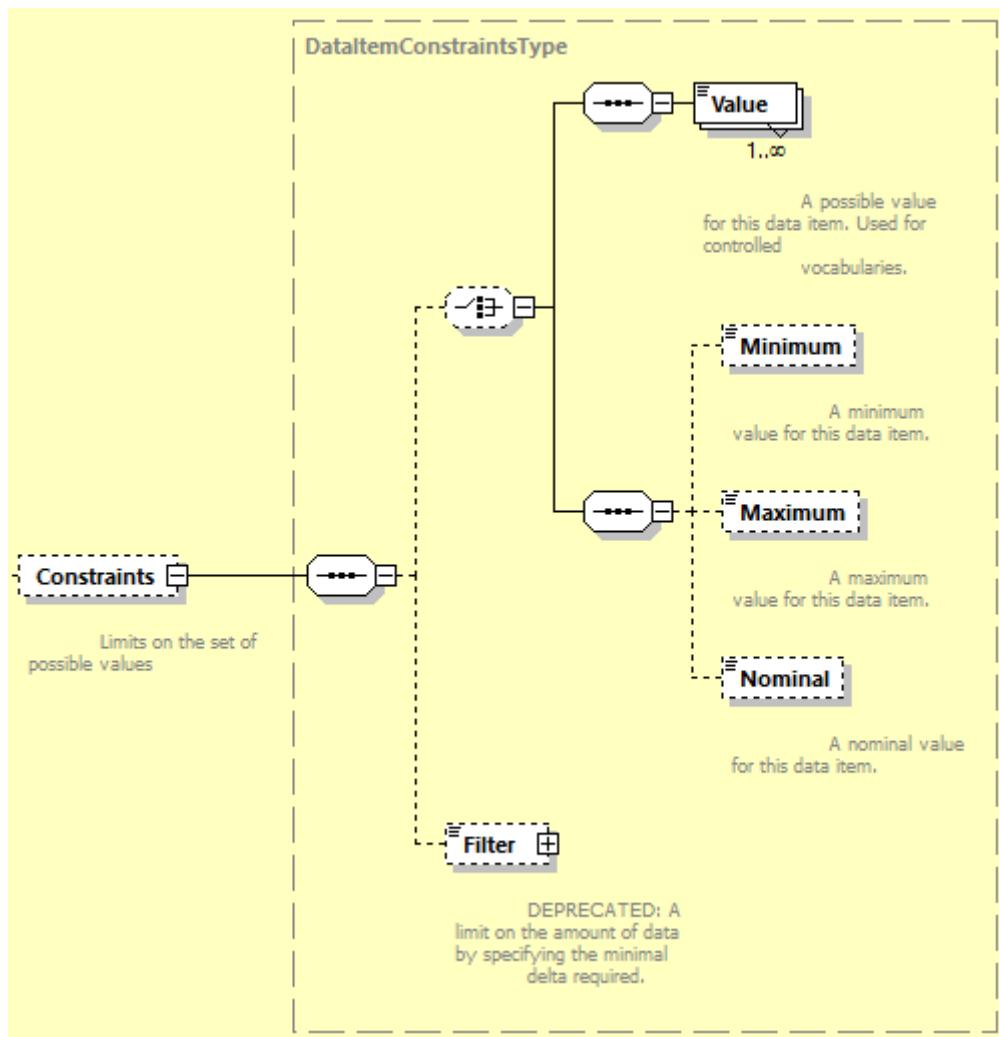

1006 The value associated with each Constraint element is reported in the CDATA for that  
1007 element.

1008

1009    **7.2.3.2.1 Schema for Constraints**

1010    The following XML schema represents the structure of the Constraints XML element and  
 1011    the elements defined for Constraints.

1012

**Figure 18: Constraints Schema Diagram**

1013

1014

1015

1016

1017 The following table identifies the elements available to identify Constraints for a measured  
 1018 value:  
 1019

Element	Description	Occurrence
Value	<p>Value represents a single data value that is expected to be reported for a DataItem element.</p> <p>The data value is provided in the CDATA for this element and may be any numeric or text content.</p> <p>When there are multiple data values that may be expected to be reported for a DataItem element, multiple Value elements may be defined.</p> <p>In the case where only one Value element is defined, the data returned in response to a Current or Sample request <b>MUST</b> be the data value defined for Value element.</p> <p>Value <b>MUST NOT</b> be used in conjunction with any other Constraint elements.</p>	0..INF
Maximum	<p>If the data reported for a data item is a range of numeric values, the expected value reported <b>MAY</b> be described with an upper limit defined by this constraint.</p> <p>The data value is provided in the CDATA for this element and <b>MUST</b> be an absolute value using the same units as the reported data.</p>	0..1
Minimum	<p>If the data reported for a data item is a range of numeric values, the expected value reported <b>MAY</b> be described with a lower limit defined by this constraint.</p> <p>The data value is provided in the CDATA for this element and <b>MUST</b> be an absolute value using the same units as the reported data.</p>	0..1
Nominal	<p>The target or expected value for this data item.</p> <p>The data value is provided in the CDATA for this element and <b>MUST</b> be an absolute value using the same units as the reported data.</p>	0..1
Filter	<p><b>DEPRECATED</b> in Version 1.4 – Moved to the Filters element of a DataItem.</p> <p><del>If the data reported for a DataItem is a numeric value, a new value MUST NOT be reported if the change from the last reported value is less than the delta given as the CDATA of this element. Filter is an abstract type XML element. As such, Filter will never appear in the XML document, but will be replaced by a Filter type. The only currently supported Filter type is MINIMUM_DELTA. The CDATA MUST be an absolute value using the same Units as the reported data. Additional filter types MAY be supported in the future.</del></p>	0..1*

1020 Note: \* Remains in schema for backwards compatibility.

1021 **7.2.3.3 Filters Element for DataItem**

1022 Filters is an optional XML container that organizes the Filter elements for DataItem.

1023 Filters contains one or more Filter XML elements.

Element	Description	Occurrence
Filters	An XML container consisting of one or more types of Filter XML elements. Only one Filters container <b>MAY</b> appear for a DataItem element.	0..1

1024

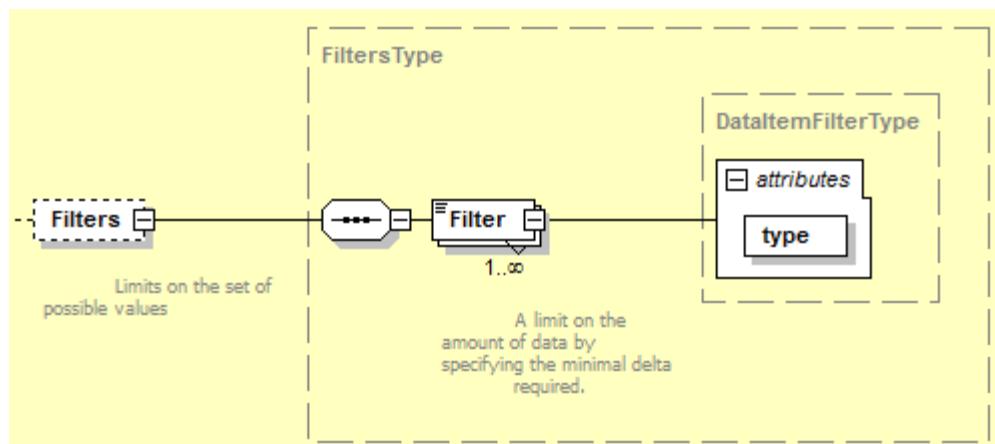

1025 **7.2.3.3.1 Filter**

1026 Filter provides a means to control when a *MTConnect Agent* records updated information for  
1027 a data item. Currently, there are two types of Filter elements defined in the MTConnect  
1028 Standard - MINIMUM\_DELTA and PERIOD. More Filter types may be added in the future.

1029 The value associated with each Filter element is reported in the CDATA for that element.

1030 The following XML schema represents the structure for Filter XML element.

1031

1032  
1033 **Figure 19: Filter Schema Diagram**

1034

1035

1036 The following table describes the types of Filter defined for a DataItem element and the  
 1037 expected behavior of a *MTConnect Agent* when a Filter is applied to DataItem element.

1038

Type	Description	Occurrence
MINIMUM_DELTA	<p>For a MINIMUM_DELTA type Filter, a new value <b>MUST NOT</b> be reported for a data item unless the measured value has changed from the last reported value by at least the delta given as the CDATA of this element.</p> <p>The CDATA <b>MUST</b> be an absolute value using the same units as the reported data.</p>	0..1 *
PERIOD	<p>For a PERIOD type Filter, the data reported for a data item is provided on a periodic basis. The PERIOD for reporting data is defined in the CDATA for the Filter.</p> <p>The CDATA <b>MUST</b> be an absolute value reported in seconds representing the time between reported samples of the value of the data item.</p> <p>If the PERIOD is smaller than one second, the number can be represented as a floating point number. For example, a PERIOD of 100 milliseconds would be 0.1</p>	0..1 *

1039

1040 Note: \* Either MINIMUM\_DELTA or PERIOD can be defined, not both.

1041

#### 1042 7.2.3.4 InitialValue Element for DataItem

1043 InitialValue is an XML element that defines the value to be set for the data item after a  
 1044 reset event.

1045 The value associated with the InitialValue element is reported in the CDATA for this  
 1046 element and **MUST** be an absolute value using the same units as the reported data.

### 1047 7.2.3.5 ResetTrigger Element for DataItem

1048 The value of some data types is periodically reset to the value of the `InitialValue` element.  
 1049 These reset events may be based upon a specific elapsed time or may be triggered by a physical  
 1050 or logical reset action that causes the reset to occur. `ResetTrigger` provides additional  
 1051 information regarding the meaning of the data – establishing an understanding of the time frame  
 1052 that the data represents so that the data may be correctly understood by a client software  
 1053 application.

Element	Description	Occurrence
ResetTrigger	ResetTrigger is an XML element that describes the reset action that causes a reset to occur.  It is additional information regarding the meaning of the data that establishes an understanding of the time frame that the data represents so that the data may be correctly understood by a client software application.	0..1

1054 The reset action that **MAY** cause a reset to occur is provided in the CDATA for this element.

1055 The reset actions that may cause a reset to occur are described in the following table.

Reset Actions	Description
ACTION_COMPLETE	The value of the <i>Data Entity</i> that is measuring an action or operation is to be reset upon completion of that action or operation.
ANNUAL	The value of the <i>Data Entity</i> is to be reset at the end of a 12-month period.
DAY	The value of the <i>Data Entity</i> is to be reset at the end of a 24-hour period.
LIFE	The value of the data item is not reset and accumulates for the entire life of the piece of equipment.
MAINTENANCE	The value of the data item is to be reset upon completion of a maintenance event.
MONTH	The value of the <i>Data Entity</i> is to be reset at the end of a monthly period.
POWER_ON	The value of the <i>Data Entity</i> is to be reset when power was applied to the piece of equipment after a planned or unplanned interruption of power has occurred.
SHIFT	The value of the <i>Data Entity</i> is to be reset at the end of a work shift.
WEEK	The value of the <i>Data Entity</i> is to be reset at the end of a 7-day period.

## 1056 8 Listing of Data Items

1057 In the MTConnect Standard, DataItem elements are defined and organized based upon the  
1058 category and type attributes.

1059 The category attribute provides a high level grouping for DataItem elements based on the  
1060 kind of information that is reported by the data item.

1061 These categories are:

1062     **SAMPLE**     A SAMPLE reports a continuously variable or analog data value.

1063     **EVENT**     An EVENT reports information representing a functional state, with two or  
1064                  more discrete values, associated with a component or it contains a message.  
1065                  The data provided may be a numeric value or text.

1066     **CONDITION**     A CONDITION reports information about the health of a piece of equipment  
1067                  and its ability to function.

1068 The type attribute specifies the specific kind of data that is reported. For some types of data  
1069 items, a subType attribute may also be used to differentiate between multiple data items of the  
1070 same type where the information reported by the data item has a different, but related, meaning.

1071 Many types of data items provide two forms of data: a value (reported as either a SAMPLE or  
1072 EVENT) and a health status (reported as a CONDITION). These DataItem types **MAY** be  
1073 defined in more than one category based on the data that they report.

1074 The following sections define the types and subtypes of DataItem elements that are defined  
1075 for each of the above categories.

### 1076 8.1 Data Items in category SAMPLE

1077 The types of DataItem elements in the SAMPLE category report data representing a  
1078 continuously changing or analog data value. This data can be measured at any point-in-time and  
1079 will always produce a result. The data provided may be a scalar floating point number or  
1080 integers that have an infinite number of possible values. The units attribute **MUST** be defined  
1081 and reported for each DataItem in this category.

1082

1083 The table below defines the types and subtypes of DataItem elements defined for the  
 1084 SAMPLE category. The subtypes are indented below their associated types.

1085

DataItem type/subType	Description	Units
ACCELERATION	Rate of change of velocity	MILLIMETER/SECOND^2
ACCUMULATED_TIME	The measurement of accumulated time for an activity or event.  <b>DEPRECATION WARNING:</b> May be deprecated in the future. Recommend using PROCESS_TIMER and MACHINE_TIMER.	SECOND
ANGULAR_ACCELERATION	Rate of change of angular velocity.	DEGREE/SECOND^2
ANGULAR_VELOCITY	Rate of change of angular position.	DEGREE/SECOND
AMPERAGE	The measurement of electrical current	AMPERE
ALTERNATING	The measurement of alternating current. If not specified further in statistic, defaults to RMS current	AMPERE
DIRECT	The measurement of DC current	AMPERE
ACTUAL	The measured amperage being delivered from a power source.	AMPERE
TARGET	The desired or preset amperage to be delivered from a power source.	AMPERE
ANGLE	The measurement of angular position	DEGREE
ACTUAL	The actual angular position as read from the physical component.	DEGREE
COMMANDED	A calculated value for angular position computed by the Controller type component	DEGREE
AXIS_FEEDRATE	The feedrate of a linear axis.	MILLIMETER/SECOND
ACTUAL	The measured value of the feedrate of a linear axis.	MILLIMETER/SECOND

DataItem type/subType	Description	Units
COMMANDED	The feedrate of a linear axis as specified by the Controller type component.  The COMMANDED feedrate is a calculated value that includes adjustments and overrides.	MILLIMETER/SECOND
JOG	The feedrate specified by a logic or motion program, by a pre-set value, or set by a switch as the feedrate for a linear axis when operating in a manual state or method (jogging).	MILLIMETER/SECOND
PROGRAMMED	The feedrate specified by a logic or motion program or set by a switch for a linear axis.	MILLIMETER/SECOND
RAPID	The feedrate specified by a logic or motion program, by a pre-set value, or set by a switch as the feedrate for a linear axis when operating in a rapid positioning mode.	MILLIMETER/SECOND
<del>OVERRIDE</del>	<del>The operator's overridden value. Percent of commanded. DEPRECATED in Version 1.3. See EVENT category data items.</del>	<del>PERCENT</del>
CLOCK_TIME	The value provided by a timing device at a specific point in time.  CLOCK_TIME <b>MUST</b> be reported in W3C ISO 8601 format.	YYYY-MM-DDThh:mm:ss.ffff
CONCENTRATION	Percentage of one component within a mixture of components	PERCENT
CONDUCTIVITY	The ability of a material to conduct electricity	SIEMENS/METER
DISPLACEMENT	The change in position of an object	MILLIMETER
ELECTRICAL_ENERGY	The measurement of electrical energy consumption by a component	WATT_SECOND

DataItem type/subType	Description	Units
EQUIPMENT_TIMER	<p>The measurement of the amount of time a piece of equipment or a sub-part of a piece of equipment has performed specific activities. Often used to determine when maintenance may be required for the equipment</p> <p>Multiple subTypes of EQUIPMENT_TIMER MAY be defined.</p> <p>A subType MUST always be specified.</p>	SECOND
LOADED	<p>Measurement of the time that the sub-parts of a piece of equipment are under load.</p> <p>Example: For traditional machine tools, this is a measurement of the time that the cutting tool is assumed to be engaged with the part.</p>	SECOND
WORKING	<p>Measurement of the time that a piece of equipment is performing any activity – the equipment is active and performing a function under load or not.</p> <p>Example: For traditional machine tools, this includes LOADED, plus rapid moves, tool changes, etc.</p>	SECOND
OPERATING	<p>Measurement of the time that the major sub-parts of a piece of equipment are powered or performing any activity whether producing a part or product or not.</p> <p>Example: For traditional machine tools, this includes WORKING, plus idle time.</p>	SECOND
POWERED	<p>The measurement of time that primary power is applied to the piece of equipment and, as a minimum, the controller or logic portion of the piece of equipment is powered and functioning or components that are required to remain on are powered.</p> <p>Example: Heaters for an extrusion machine that are required to be powered even when the equipment is turned off.</p>	SECOND
DELAY	Measurement of the time that a piece of equipment is waiting for an event or an action to occur.	SECOND

DataItem type/subType	Description	Units
FILL_LEVEL	The measurement of the amount of a substance remaining compared to the planned maximum amount of that substance	PERCENT
FLOW	The rate of flow of a fluid	LITER/SECOND
FREQUENCY	The measurement of the number of occurrences of a repeating event per unit time	HERTZ
GLOBAL_POSITION	<b>DEPRECATED</b> in <i>Version 1.1</i>	
LEVEL	<b>DEPRECATED</b> in <i>Version 1.2</i> . See FILL_LEVEL	
LENGTH	The length of an object	MILLIMETER
STANDARD	The standard or original length of an object.	MILLIMETER
REMAINING	The remaining total length of an object.	MILLIMETER
USEABLE	The remaining useable length of an object.	MILLIMETER
LINEAR_FORCE	The measure of the push or pull introduced by an actuator or exerted on an object.	NEWTON
LOAD	The measurement of the actual versus the standard rating of a piece of equipment.	PERCENT
MASS	The measurement of the mass of an object(s) or an amount of material.	KILOGRAM
PATH_FEEDRATE	The feedrate for the axes, or a single axis, associated with a Path component– a vector.	MILLIMETER/SECOND
ACTUAL	The measured value of the feedrate of the axes, or a single axis, associated with a Path component.	MILLIMETER/SECOND
COMMAND	<p>The feedrate as specified by the Controller type component for the axes, or a single axis, associated with a Path component.</p> <p>The COMMAND feedrate is a calculated value that includes adjustments and overrides.</p>	MILLIMETER/SECOND

DataItem type/subType	Description	Units
JOG	The feedrate specified by a logic or motion program, by a pre-set value, or set by a switch as the feedrate for the axes, or a single axis, associated with a Path when operating in a manual state or method (jogging).	MILLIMETER/SECOND
PROGRAMMED	The feedrate specified by a logic or motion program or set by a switch as the feedrate for the axes, or a single axis, associated with a Path.	MILLIMETER/SECOND
RAPID	The feedrate specified by a logic or motion program, by a pre-set value, or set by a switch as the feedrate for the axes, or a single axis, associated with a Path when operating in a rapid positioning mode.	MILLIMETER/SECOND
<del>OVERRIDE</del>	<del>The operator's overridden value. Percent of commanded. DEPRECATED in Version 1.3. See EVENT category DataItems.</del>	<del>PERCENT</del>
PATH_POSITION	<p>A measured or calculated position of a control point associated with a CONTROLLER element, or PATH element if provided, of a piece of equipment.</p> <p>The control point <b>MUST</b> be reported as a set of space-delimited floating-point numbers representing a point in 3-D space. The position of the control point <b>MUST</b> be reported in units of MILLIMETER and listed in order of X, Y, and Z referenced to the coordinate system of the piece of equipment.</p> <p>Any control point representing a position in 1-D or 2-D space <b>MAY</b> be represented in terms of 3-D space by setting any undefined coordinate to zero (0).</p> <p>PATH_POSITION <b>SHOULD</b> be further defined with a coordinateSystem attribute. If a coordinateSystem attribute is not specified, the position of the control point <b>MUST</b> be reported in WORK coordinates.</p>	MILLIMETER_3D
ACTUAL	The measured position of the current program control point as reported by the piece of equipment.	MILLIMETER_3D

DataItem type/subType	Description	Units
COMMANDED	The position computed by the Controller type component.	MILLIMETER_3D
TARGET	The desired end position for a movement or a series of movements. Multiple discrete movements may need to be completed to achieve the final TARGET position.	MILLIMETER_3D
PROBE	The position provided by a measurement probe.	MILLIMETER_3D
PH	The measure of the acidity or alkalinity.	PH
POSITION	A calculated or measured position related to a Component element.  POSITION <b>SHOULD</b> be further defined with a coordinateSystem attribute. If a coordinateSystem attribute is not specified, the position of the control point <b>MUST</b> be reported in MACHINE coordinates.	MILLIMETER
ACTUAL	The physical measured position of the control point for a Component.	MILLIMETER
COMMANDED	A position calculated by the Controller type component for a discrete movement.	MILLIMETER
PROGRAMMED	The position of the control point for a Component specified by a logic or motion program	MILLIMETER
TARGET	The desired end position of the control point for a Component resulting from a movement or a series of movements.  Multiple discrete movements may need to be completed to achieve the final TARGET position.	MILLIMETER
POWER_FACTOR	The measurement of the ratio of real power flowing to a load to the apparent power in that AC circuit.	PERCENT
PRESSURE	The force per unit area exerted by a gas or liquid	PASCAL

DataItem type/subType	Description	Units
PROCESS_TIMER	<p>The measurement of the amount of time a piece of equipment has performed different types of activities associated with the process being performed at that piece of equipment.</p> <p>Multiple subtypes of PROCESS_TIMER may be defined.</p> <p>Typically, PROCESS_TIMER <b>SHOULD</b> be modeled as a data item for the Device element, but <b>MAY</b> be modeled for either a Controller or Path Structural Element in the XML document.</p> <p>A subType <b>MUST</b> always be specified.</p>	SECOND
PROCESS	The measurement of the time from the beginning of production of a part or product on a piece of equipment until the time that production is complete for that part or product on that piece of equipment. This includes the time that the piece of equipment is running, producing parts or products, or in the process of producing parts.	SECOND
DELAY	Measurement of the time that a process is waiting and unable to perform its intended function.	SECOND
RESISTANCE	The degree to which a substance opposes the passage of an electric current.	OHM
ROTARY_VELOCITY	The rotational speed of a rotary axis.	REVOLUTION/MINUTE
ACTUAL	The measured value of rotational speed that the rotary axis is spinning.	REVOLUTION/MINUTE
COMMANDED	<p>The rotational speed as specified by the Controller type component.</p> <p>The COMMANDED velocity is a calculated value that includes adjustments and overrides.</p>	REVOLUTION/MINUTE
PROGRAMMED	The rotational velocity specified by a logic or motion program or set by a switch	REVOLUTION/MINUTE
— OVERRIDE	The operator's overridden value. <b>Percent of commanded. DEPRECATED in Version 1.3.</b> See EVENT category DataItems.	PERCENT

DataItem type/subType	Description	Units
SOUND_LEVEL	Measurement of a sound level or sound pressure level relative to atmospheric pressure	DECIBEL
NO_SCALE	No weighting factor on the frequency scale	DECIBEL
A_SCALE	A Scale weighting factor. This is the default weighting factor if no factor is specified	DECIBEL
B_SCALE	B Scale weighting factor	DECIBEL
C_SCALE	C Scale weighting factor	DECIBEL
D_SCALE	D Scale weighting factor	DECIBEL
SPINDLE_SPEED	<b>DEPRECATED</b> in Version 1.2. Replaced by ROTARY_VELOCITY	
—ACTUAL	The rotational speed of a rotary axis. ROTARY_MODE <b>MUST</b> be SPINDLE.	REVOLUTION/MINUTE
—COMMANDED	The rotational speed the as specified by the Controller type Component.	REVOLUTION/MINUTE
— OVERRIDE	The operator's overridden value. Percent of commanded.	PERCENT
STRAIN	The amount of deformation per unit length of an object when a load is applied.	PERCENT
TEMPERATURE	The measurement of temperature	CELSIUS
TENSION	A measurement of a force that stretches or elongates an object	NEWTON
TIILT	A measurement of angular displacement	MICRO_RADIAN
TORQUE	The turning force exerted on an object or by an object	NEWTON_METER
VOLT_AMPERE	The measure of the apparent power in an electrical circuit, equal to the product of root-mean-square (RMS) voltage and RMS current (commonly referred to as VA)	VOLT_AMPERE
VOLT_AMPERE_REACTIVE	The measurement of reactive power in an AC electrical circuit (commonly referred to as VAR)	VOLT_AMPERE_REACTIVE

DataItem type/subType	Description	Units
VELOCITY	The rate of change of position.	MILLIMETER/SECOND
VISCOSITY	A measurement of a fluid's resistance to flow	PASCAL_SECOND
VOLTAGE	The measurement of electrical potential between two points	VOLT
ALTERNATING	The measurement of alternating voltage. If not specified further in statistic, defaults to RMS voltage	VOLT
DIRECT	The measurement of DC voltage	VOLT
ACTUAL	The measured voltage being delivered from a power source.	VOLT
TARGET	The desired or preset voltage to be delivered from a power source.	VOLT
WATTAGE	The measurement of power flowing through or dissipated by an electrical circuit or piece of equipment.	WATT
ACTUAL	The measured wattage being delivered from a power source.	WATT
TARGET	The desired or preset wattage to be delivered from a power source.	WATT

1086

## 1087 8.2 Data Items in category EVENT

1088 DataItem types in the EVENT category represent a discrete piece of information from a piece  
 1089 of equipment. EVENT does not have intermediate values that vary over time.

1090 An EVENT is information that, when provided at any specific point in time, represents the  
 1091 current state of the piece of equipment.

1092 There are two types of EVENT: those representing state, with two or more discrete values, and  
 1093 those representing messages that contain plain text data.

1094 The table below defines the DataItem types and subtypes defined for the EVENT category.  
 1095 The subtypes are indented below their associated types.

DataItem type/subType	Description
ACTUATOR_STATE	<p>Represents the operational state of an apparatus for moving or controlling a mechanism or system.</p> <p>The valid data value <b>MUST</b> be ACTIVE or INACTIVE.</p>
ALARM	<b>DEPRECATED</b> in <i>Version 1.1</i> . Replaced with CONDITION category.
ACTIVE_AXES	<p>The set of axes currently associated with a Path or Controller <i>Structural Element</i>.</p> <p>If this DataItem is not provided, it will be assumed that all axes are currently associated with the Controller <i>Structural Element</i> and with an individual Path.</p> <p>The valid data value for ACTIVE_AXES <b>SHOULD</b> be a space-delimited set of axes reported as the value of the name attribute for each axis. If name is not available, the piece of equipment <b>MUST</b> report the value of the nativeName attribute for each axis.</p>
AVAILABILITY	<p>Represents the <i>Agent's</i> ability to communicate with the data source.</p> <p>This <b>MUST</b> be provided for a Device Element and <b>MAY</b> be provided for any other <i>Structural Element</i>.</p> <p>The valid data value <b>MUST</b> be AVAILABLE or UNAVAILABLE .</p>
AXIS_COUPLING	<p>Describes the way the axes will be associated to each other.</p> <p>This is used in conjunction with COUPLED_AXES to indicate the way they are interacting.</p> <p>The valid data value <b>MUST</b> be TANDEM, SYNCHRONOUS, MASTER, and SLAVE.</p> <p>The coupling <b>MUST</b> be viewed from the perspective of a specific axis. Therefore, a MASTER coupling indicates that this axis is the master for the COUPLED_AXES.</p>
AXIS_FEEDRATE_OVERRIDE	<p>The value of a signal or calculation issued to adjust the feedrate of an individual linear type axis.</p> <p>The value provided for AXIS_FEEDRATE_OVERRIDE is expressed as a percentage of the designated feedrate for the axis.</p> <p>When AXIS_FEEDRATE_OVERRIDE is applied, the resulting commanded feedrate for the axis is limited to the value of the original feedrate multiplied by the value of the AXIS_FEEDRATE_OVERRIDE.</p> <p>There <b>MAY</b> be different subtypes of AXIS_FEEDRATE_OVERRIDE; each representing an override value for a designated subtype of feedrate depending on the state of operation of the axis. The subtypes of operation of an axis are currently defined as PROGRAMMED, JOG, and RAPID.</p>

DataItem type/subType	Description
JOG	<p>The value of a signal or calculation issued to adjust the feedrate of an individual linear type axis when that axis is being operated in a manual state or method (jogging).</p> <p>When the JOG subtype of AXIS_FEEDRATE_OVERRIDE is applied, the resulting commanded feedrate for the axis is limited to the value of the original JOG subtype of the AXIS_FEEDRATE multiplied by the value of the JOG subtype of AXIS_FEEDRATE_OVERRIDE.</p>
PROGRAMMED	<p>The value of a signal or calculation issued to adjust the feedrate of an individual linear type axis that has been specified by a logic or motion program or set by a switch.</p> <p>When the PROGRAMMED subtype of AXIS_FEEDRATE_OVERRIDE is applied, the resulting commanded feedrate for the axis is limited to the value of the original PROGRAMMED subtype of the AXIS_FEEDRATE multiplied by the value of the PROGRAMMED subtype of AXIS_FEEDRATE_OVERRIDE.</p>
RAPID	<p>The value of a signal or calculation issued to adjust the feedrate of an individual linear type axis that is operating in a rapid positioning mode.</p> <p>When the RAPID subtype of AXIS_FEEDRATE_OVERRIDE is applied, the resulting commanded feedrate for the axis is limited to the value of the original RAPID subtype of the AXIS_FEEDRATE multiplied by the value of the RAPID subtype of AXIS_FEEDRATE_OVERRIDE.</p>
AXIS_INTERLOCK	<p>An indicator of the state of the axis lockout function when power has been removed and the axis is allowed to move freely.</p> <p>The valid data value <b>MUST</b> be ACTIVE or INACTIVE.</p>
AXIS_STATE	<p>An indicator of the controlled state of a LINEAR or ROTARY component representing an axis.</p> <p>The valid data value <b>MUST</b> be HOME, TRAVEL, PARKED, or STOPPED.</p>
BLOCK	<p>The line of code or command being executed by a Controller Structural Element.</p> <p>The value reported for BLOCK <b>MUST</b> include the entire expression for a line of program code, including all parameters.</p>
BLOCK_COUNT	<p>The total count of the number of blocks of program code that have been executed since execution started.</p> <p>BLOCK_COUNT counts blocks of program code executed regardless of program structure (e.g., looping or branching within the program).</p> <p>The starting value for BLOCK_COUNT <b>MAY</b> be established by an initial value provided in the Constraint element defined for the data item.</p>

DataItem type/subType	Description
CHUCK_INTERLOCK	An indication of the state of an interlock function or control logic state intended to prevent the associated CHUCK component from being operated.  The valid data value <b>MUST</b> be ACTIVE or INACTIVE.
MANUAL_UNCLAMP	An indication of the state of an operator controlled interlock that can inhibit the ability to initiate an unclamp action of an electronically controlled chuck.  The valid data value <b>MUST</b> be ACTIVE or INACTIVE.  When MANUAL_UNCLAMP is ACTIVE, it is expected that a chuck cannot be unclamped until MANUAL_UNCLAMP is set to INACTIVE.
CHUCK_STATE	An indication of the operating state of a mechanism that holds a part or stock material during a manufacturing process. It may also represent a mechanism that holds any other mechanism in place within a piece of equipment.  The valid data value <b>MUST</b> be OPEN, CLOSED, or UNLATCHED.
CODE	<b>DEPRECATED</b> in <i>Version 1.1</i> .
COMPOSITION_STATE	An indication of the operating condition of a mechanism represented by a Composition type element.  A subType <b>MUST</b> always be specified.  A compositionId <b>MUST</b> always be specified.
ACTION	An indication of the operating state of a mechanism represented by a Composition type component.  The operating state indicates whether the Composition element is activated or disabled.  The valid data value <b>MUST</b> be ACTIVE or INACTIVE.
LATERAL	An indication of the position of a mechanism that may move in a lateral direction. The mechanism is represented by a Composition type component.  The position information indicates whether the Composition element is positioned to the right, to the left, or is in transition.  The valid data value <b>MUST</b> be RIGHT, LEFT, or TRANSITIONING.
MOTION	An indication of the open or closed state of a mechanism. The mechanism is represented by a Composition type component.  The operating state indicates whether the state of the Composition element is open, closed, or unlatched.  The valid data value <b>MUST</b> be OPEN, UNLATCHED, or CLOSED.

DataItem type/subType	Description
SWITCHED	<p>An indication of the activation state of a mechanism represented by a Composition type component.</p> <p>The activation state indicates whether the Composition element is activated or not.</p> <p>The valid data value <b>MUST</b> be ON or OFF.</p>
VERTICAL	<p>An indication of the position of a mechanism that may move in a vertical direction. The mechanism is represented by a Composition type component.</p> <p>The position information indicates whether the Composition element is positioned to the top, to the bottom, or is in transition.</p> <p>The valid data value <b>MUST</b> be UP, DOWN, or TRANSITIONING.</p>
CONTROLLER_MODE	<p>The current mode of the Controller component.</p> <p>The valid data value <b>MUST</b> be AUTOMATIC, MANUAL, MANUAL_DATA_INPUT, SEMI_AUTOMATIC, or EDIT.</p>
CONTROLLER_MODE_OVERRIDE	<p>A setting or operator selection that changes the behavior of a piece of equipment.</p> <p>A subType <b>MUST</b> always be specified.</p>
DRY_RUN	<p>A setting or operator selection used to execute a test mode to confirm the execution of machine functions.</p> <p>The valid data value <b>MUST</b> be ON or OFF.</p> <p>When DRY_RUN is ON, the equipment performs all of its normal functions, except no part or product is produced. If the equipment has a spindle, spindle operation is suspended.</p>
SINGLE_BLOCK	<p>A setting or operator selection that changes the behavior of the controller on a piece of equipment.</p> <p>The valid data value <b>MUST</b> be ON or OFF.</p> <p>Program execution is paused after each BLOCK of code is executed when SINGLE_BLOCK is ON.</p> <p>When SINGLE_BLOCK is ON, EXECUTION <b>MUST</b> change to INTERRUPTED after completion of each BLOCK of code.</p>
MACHINE_AXIS_LOCK	<p>A setting or operator selection that changes the behavior of the controller on a piece of equipment.</p> <p>The valid data value <b>MUST</b> be ON or OFF.</p> <p>When MACHINE_AXIS_LOCK is ON, program execution continues normally, but no equipment motion occurs</p>

DataItem type/subType	Description
OPTIONAL_STOP	<p>A setting or operator selection that changes the behavior of the controller on a piece of equipment.</p> <p>The valid data value <b>MUST</b> be ON or OFF.</p> <p>The program execution is stopped after a specific program block is executed when OPTIONAL_STOP is ON.</p> <p>In the case of a G-Code program, a program BLOCK containing a M01 code designates the command for an OPTIONAL_STOP.</p> <p>EXECUTION <b>MUST</b> change to OPTIONAL_STOP after a program block specifying an optional stop is executed and the OPTIONAL_STOP selection is ON.</p>
TOOL_CHANGE_STOP	<p>A setting or operator selection that changes the behavior of the controller on a piece of equipment.</p> <p>The valid data value <b>MUST</b> be ON or OFF.</p> <p>Program execution is paused when a command is executed requesting a cutting tool to be changed.</p> <p>EXECUTION <b>MUST</b> change to INTERRUPTED after completion of the command requesting a cutting tool to be changed and TOOL_CHANGE_STOP is ON.</p>
COUPLED_AXES	<p>Refers to the set of associated axes.</p> <p>The valid data value for COUPLED_AXES <b>SHOULD</b> be a space-delimited set of axes reported as the value of the name attribute for each axis. If name is not available, the piece of equipment <b>MUST</b> report the value of the nativeName attribute for each axis.</p>
DIRECTION	<p>The direction of motion. A subType <b>MUST</b> always be specified.</p>
ROTARY	<p>The rotational direction of a rotary motion using the right hand rule convention.</p> <p>The valid data value <b>MUST</b> be CLOCKWISE or COUNTER_CLOCKWISE.</p>
LINEAR	<p>The direction of motion of a linear motion.</p> <p>The valid data value <b>MUST</b> be POSITIVE or NEGATIVE.</p>
DOOR_STATE	<p>The opened or closed state of the door.</p> <p>The valid data value <b>MUST</b> be OPEN, UNLATCHED, or CLOSED.</p>
END_OF_BAR	<p>An indication of whether the end of a piece of bar stock being feed by a bar feeder has been reached.</p> <p>The valid data value <b>MUST</b> be expressed as a Boolean expression of YES or NO.</p>

DataItem type/subType	Description
PRIMARY	<p>Specific applications <b>MAY</b> reference one or more locations on a piece of bar stock as the indication for the END_OF_BAR. The main or most important location <b>MUST</b> be designated as the PRIMARY indication for the END_OF_BAR.</p> <p>If no subType is specified, PRIMARY <b>MUST</b> be the default END_OF_BAR indication.</p>
AUXILIARY	<p>When multiple locations on a piece of bar stock are referenced as the indication for the END_OF_BAR, the additional location(s) <b>MUST</b> be designated as AUXILIARY indication(s) for the END_OF_BAR.</p>
EMERGENCY_STOP	<p>The current state of the emergency stop signal.</p> <p>The valid data value <b>MUST</b> be ARMED (the circuit is complete and the device is allowed to operate) or TRIGGERED (the circuit is open and the device must cease operation).</p>
EQUIPMENT_MODE	<p>An indication that a piece of equipment, or a sub-part of a piece of equipment, is performing specific types of activities.</p> <p>EQUIPMENT_MODE <b>MAY</b> have more than one subtype defined.</p> <p>A subType <b>MUST</b> always be specified.</p>
LOADED	<p>An indication that the sub-parts of a piece of equipment are under load.</p> <p>Example: For traditional machine tools, this is an indication that the cutting tool is assumed to be engaged with the part.</p> <p>The valid data value <b>MUST</b> be ON or OFF.</p>
WORKING	<p>An indication that a piece of equipment is performing any activity – the equipment is active and performing a function under load or not.</p> <p>Example: For traditional machine tools, this includes when the piece of equipment is LOADED, making rapid moves, executing a tool change, etc.</p> <p>The valid data value <b>MUST</b> be ON or OFF.</p>
OPERATING	<p>An indication that the major sub-parts of a piece of equipment are powered or performing any activity whether producing a part or product or not.</p> <p>Example: For traditional machine tools, this includes when the piece of equipment is WORKING or it is idle.</p> <p>The valid data value <b>MUST</b> be ON or OFF.</p>

DataItem type/subType	Description
POWERED	<p>An indication that primary power is applied to the piece of equipment and, as a minimum, the controller or logic portion of the piece of equipment is powered and functioning or components that are required to remain on are powered.</p> <p>Example: Heaters for an extrusion machine that required to be powered even when the equipment is turned off.</p> <p>The valid data value <b>MUST</b> be ON or OFF.</p>
DELAY	An indication that a piece of equipment is waiting for an event or an action to occur.
EXECUTION	<p>The execution status of the Controller.</p> <p>The valid data value <b>MUST</b> be READY, ACTIVE, INTERRUPTED, FEED_HOLD, STOPPED, OPTIONAL_STOP, PROGRAM_STOPPED, or PROGRAM_COMPLETED.</p>
FUNCTIONAL_MODE	<p>The current intended production status of the device or component.</p> <p>Typically, the FUNCTIONAL_MODE <b>SHOULD</b> be modeled as a data item for the Device element, but <b>MAY</b> be modeled for any <i>Structural Element</i> in the XML document.</p> <p>The valid data value <b>MUST</b> be PRODUCTION, SETUP, TEARDOWN, MAINTENANCE, or PROCESS_DEVELOPMENT.</p>
HARDNESS	<p>The measurement of the hardness of a material.</p> <p>The measurement does not provide a unit.</p> <p>A subType <b>MUST</b> always be specified to designate the hardness scale associated with the measurement.</p>
ROCKWELL	A scale to measure the resistance to deformation of a surface.
VICKERS	A scale to measure the resistance to deformation of a surface.
SHORE	A scale to measure the resistance to deformation of a surface.
BRINELL	A scale to measure the resistance to deformation of a surface.
LEEB	A scale to measure the elasticity of a surface.
MOHS	A scale to measure the resistance to scratching of a surface.
INTERFACE_STATE	<p>The current functional or operational state of an Interface type element indicating whether the interface is active or is not currently functioning.</p> <p>The valid data value <b>MUST</b> be ENABLED or DISABLED.</p>

DataItem type/subType	Description
LINE	<p>The current line of code being executed.</p> <p><del>The data will be an alpha numeric value representing the line number of the current line of code being executed.</del></p> <p><b>DEPRECATED</b> in Version 1.4</p>
MAXIMUM	The maximum line number of the code being executed.
MINIMUM	The minimum line number of the code being executed.
LINE_LABEL	An optional identifier for a BLOCK of code in a PROGRAM.
LINE_NUMBER	<p>A reference to the position of a block of program code within a control program. The line number <b>MAY</b> represent either an absolute position starting with the first line of the program or an incremental position relative to the occurrence of the last LINE_LABEL.</p> <p>LINE_NUMBER does not change subject to any looping or branching in a control program.</p> <p>A subType <b>MUST</b> be defined.</p>
ABSOLUTE	The position of a block of program code relative to the beginning of the control program.
INCREMENTAL	The position of a block of program code relative to the occurrence of the last LINE_LABEL encountered in the control program.
MATERIAL	<p>The identifier of a material used or consumed in the manufacturing process.</p> <p>The valid data value <b>MUST</b> be a text string.</p>
MESSAGE	Any text string of information to be transferred from a piece of equipment to a client software application.
OPERATOR_ID	<p>The identifier of the person currently responsible for operating the piece of equipment.</p> <p><b>DEPRECATION WARNING:</b> May be deprecated in the future. See USER below.</p>
PALLET_ID	<p>The identifier for a pallet.</p> <p>The valid data value <b>MUST</b> be a text string.</p>
PART_COUNT	<p>The current count of parts produced as represented by the Controller.</p> <p>The valid data value <b>MUST</b> be an integer value.</p>
ALL	The count of all the parts produced. If the subtype is not given, this is the default.

DataItem type/subType	Description
GOOD	Indicates the count of correct parts made.
BAD	Indicates the count of incorrect parts produced.
TARGET	Indicates the number of parts that are projected or planned to be produced.
REMAINING	The number of parts remaining in stock or to be produced.
PART_ID	An identifier of a part in a manufacturing operation. The valid data value <b>MUST</b> be a text string.
PART_NUMBER	An identifier of a part or product moving through the manufacturing process. The valid data value <b>MUST</b> be a text string.
PATH_FEEDRATE_OVERRIDE	The value of a signal or calculation issued to adjust the feedrate for the axes associated with a Path component that may represent a single axis or the coordinated movement of multiple axes.  The value provided for PATH_FEEDRATE_OVERRIDE is expressed as a percentage of the designated feedrate for the path.  When PATH_FEEDRATE_OVERRIDE is applied, the resulting commanded feedrate for the path is limited to the value of the original feedrate multiplied by the value of the PATH_FEEDRATE_OVERRIDE.  There <b>MAY</b> be different subtypes of PATH_FEEDRATE_OVERRIDE; each representing an override value for a designated subtype of feedrate depending on the state of operation of the path. The states of operation of a path are currently defined as PROGRAMMED, JOG, and RAPID.
JOG	The value of a signal or calculation issued to adjust the feedrate of the axes associated with a Path component when the axes, or a single axis, are being operated in a manual mode or method (jogging).  When the JOG subtype of PATH_FEEDRATE_OVERRIDE is applied, the resulting commanded feedrate for the axes, or a single axis, associated with the path are limited to the value of the original JOG subtype of the PATH_FEEDRATE multiplied by the value of the JOG subtype of PATH_FEEDRATE_OVERRIDE.

DataItem type/subType	Description
PROGRAMMED	<p>The value of a signal or calculation issued to adjust the feedrate of the axes associated with a Path component when the axes, or a single axis, are operating as specified by a logic or motion program or set by a switch.</p> <p>When the PROGRAMMED subtype of PATH_FEEDRATE_OVERRIDE is applied, the resulting commanded feedrate for the axes, or a single axis, associated with the path are limited to the value of the original PROGRAMMED subtype of the PATH_FEEDRATE multiplied by the value of the PROGRAMMED subtype of PATH_FEEDRATE_OVERRIDE.</p>
RAPID	<p>The value of a signal or calculation issued to adjust the feedrate of the axes associated with a Path component when the axes, or a single axis, are being operated in a rapid positioning mode or method (rapid).</p> <p>When the RAPID subtype of PATH_FEEDRATE_OVERRIDE is applied, the resulting commanded feedrate for the axes, or a single axis, associated with the path are limited to the value of the original RAPID subtype of the PATH_FEEDRATE multiplied by the value of the RAPID subtype of PATH_FEEDRATE_OVERRIDE.</p>
PATH_MODE	<p>Describes the operational relationship between a PATH Structural Element and another PATH Structural Element for pieces of equipment comprised of multiple logical groupings of controlled axes or other logical operations.</p> <p>The valid data value <b>MUST</b> be INDEPENDENT, MASTER, SYNCHRONOUS, or MIRROR.</p> <p>The default value <b>MUST</b> be INDEPENDENT if PATH_MODE is not specified.</p>
POWER_STATE	<p>The indication of the status of the source of energy for a Structural Element to allow it to perform its intended function or the state of an enabling signal providing permission for the Structural Element to perform its functions.</p> <p>The valid data value <b>MUST</b> be ON or OFF.</p> <p><b>DEPRECATION WARNING:</b> May be deprecated in the future.</p>
LINE	The state of the power source for the Structural Element.
CONTROL	The state of the enabling signal or control logic that enables or disables the function or operation of the Structural Element.
<del>POWER_STATUS</del>	<b>DEPRECATED</b> in Version 1.1.
PROGRAM	<p>The name of the logic or motion program being executed by the Controller component.</p> <p>The valid data value <b>MUST</b> be a text string.</p>

DataItem type/subType	Description
PROGRAM_EDIT	<p>An indication of the Controller component's program editing mode.</p> <p>On many controls, a program can be edited while another program is currently being executed.</p> <p>The valid data value <b>MUST</b> be:</p> <ul style="list-style-type: none"> <li>ACTIVE: The controller is in the program edit mode.</li> <li>READY: The controller is capable of entering the program edit mode and no function is inhibiting a change of mode.</li> <li>NOT_READY: A function is inhibiting the controller from entering the program edit mode.</li> </ul>
PROGRAM_EDIT_NAME	<p>The name of the program being edited. This is used in conjunction with PROGRAM_EDIT when in ACTIVE state.</p> <p>The valid data value <b>MUST</b> be a text string.</p>
PROGRAM_COMMENT	<p>A comment or non-executable statement in the control program.</p> <p>The valid data value <b>MUST</b> be a text string.</p>
PROGRAM_HEADER	<p>The non-executable header section of the control program.</p> <p>The valid data value <b>MUST</b> be a text string.</p>
ROTARY_MODE	<p>The mode for a Rotary type axis.</p> <p>The valid data value <b>MUST</b> be SPINDLE, INDEX, or CONTOUR.</p>
ROTARY_VELOCITY_OVERRIDE	<p>A command issued to adjust the programmed velocity for a Rotary type axis.</p> <p>This command represents a percentage change to the velocity calculated by a logic or motion program or set by a switch for a Rotary type axis.</p> <p>ROTARY_VELOCITY_OVERRIDE is expressed as a percentage of the programmed ROTARY_VELOCITY.</p>
SERIAL_NUMBER	<p>The serial number associated with a Component, Asset, or Device.</p> <p>The valid data value <b>MUST</b> be a text string.</p>
SPINDLE_INTERLOCK	<p>An indication of the status of the spindle for a piece of equipment when power has been removed and it is free to rotate.</p> <p>The valid data value <b>MUST</b> be:</p> <ul style="list-style-type: none"> <li>ACTIVE if power has been removed and the spindle cannot be operated.</li> <li>INACTIVE if power to the spindle has not been deactivated.</li> </ul>
TOOL_ID	<p><b>DEPRECATED</b> in Version 1.2. See TOOL_ASSET_ID. The identifier of the tool currently in use for a given Path</p>

DataItem type/subType	Description
TOOL_ASSET_ID	The identifier of an individual tool asset. The valid data value <b>MUST</b> be a text string.
TOOL_NUMBER	The identifier of a tool provided by the piece of equipment controller. The valid data value <b>MUST</b> be a text string.
TOOL_OFFSET	A reference to the tool offset variables applied to the active cutting tool associated with a Path in a Controller type component. The valid data value <b>MUST</b> be a text string. The reported value returned for TOOL_OFFSET identifies the location in a table or list where the actual tool offset values are stored. A subType <b>MUST</b> always be specified.
RADIAL	A reference to a radial type tool offset variable.
LENGTH	A reference to a length type tool offset variable.
USER	The identifier of the person currently responsible for operating the piece of equipment. A subType <b>MUST</b> always be specified.
OPERATOR	The identifier of the person currently responsible for operating the piece of equipment.
MAINTENANCE	The identifier of the person currently responsible for performing maintenance on the piece of equipment.
SET_UP	The identifier of the person currently responsible for preparing a piece of equipment for production or restoring the piece of equipment to a neutral state after production.
WIRE	The identifier for the type of wire used as the cutting mechanism in Electrical Discharge Machining or similar processes. The valid data value <b>MUST</b> be a text string.
WORKHOLDING_ID	The identifier for the workholding currently in use. The valid data value <b>MUST</b> be a text string.
WORK_OFFSET	A reference to the offset variables for a work piece or part associated with a Path in a Controller type component. The valid data value <b>MUST</b> be a text string. The reported value returned for WORK_OFFSET identifies the location in a table or list where the actual tool offset values are stored.

## 1097 8.3 Data Items in category CONDITION

- 1098 CONDITION category data items report data representing a *Structural Element*'s status  
 1099 regarding its ability to operate or it provides an indication whether the data reported for the  
 1100 *Structural Element* is within an expected range.
- 1101 CONDITION is reported differently than SAMPLE or EVENT. CONDITION **MUST** be reported  
 1102 as NORMAL, WARNING, or FAULT.
- 1103 All DataItem types in the SAMPLE category **MAY** have associated CONDITION states.  
 1104 CONDITION states indicate whether the value for the data is within an expected range and  
 1105 **MUST** be reported as NORMAL, or the value is unexpected or out of tolerance for the data and a  
 1106 WARNING or FAULT **MUST** be provided.
- 1107 Some DataItem types in the EVENT category **MAY** have associated CONDITION states.
- 1108 Additional CONDITION types are provided to represent the health and fault status of *Structural*  
 1109 *Elements*. The table below defines these additional DataItem types.
- 1110 CONDITION type data items are unlike other data item types since they **MAY** have multiple  
 1111 concurrently active values at any point in time.

1112

DataItem Type	Description
ACTUATOR	An indication of a fault associated with an actuator.
CHUCK_INTERLOCK	An indication of the operational condition of the interlock function for an electronically controller chuck.
COMMUNICATIONS	An indication that the piece of equipment has experienced a communications failure.
DATA_RANGE	An indication that the value of the data associated with a measured value or a calculation is outside of an expected range.
DIRECTION	An indication of a fault associated with the direction of motion of a <i>Structural Element</i> .
END_OF_BAR	An indication that the end of a piece of bar stock has been reached.
HARDWARE	An indication of a fault associated with the hardware subsystem of the <i>Structural Element</i> .
INTERFACE_STATE	An indication of the operation condition of an Interface component.
LOGIC_PROGRAM	An indication that an error occurred in the logic program or programmable logic controller (PLC) associated with a piece of equipment.

DataItem Type	Description
MOTION_PROGRAM	An indication that an error occurred in the motion program associated with a piece of equipment
SYSTEM	A general purpose indication of a fault associated with a piece of equipment that is classified elsewhere.

1113  
1114

1115 

## 9 Sensor

1116 *Sensor* is a unique type of a piece of equipment. A *Sensor* is typically comprised of two major  
 1117 components: a *sensor unit* that provides signal processing, conversion, and communications and  
 1118 the *sensing elements* that provides a signal or measured value.

1119 In MTConnect, the *sensor unit* is modeled as a *Lower Level Component* called *Sensor*. The  
 1120 *sensing element* may be modeled as a *Composition* element of a *Sensor* element and the  
 1121 measured value would be modeled as a *DataItem* (See *Section 8* of this document for more  
 1122 information on *DataItem* elements). Each *sensor unit* may have multiple *sensing elements*;  
 1123 each representing the data for a variety of measured values.

1124 Example: A pressure transducer could be modeled as a *Sensor* (*Component*) with a *name* =  
 1125 *Pressure Transducer B* and its measured value could be modeled as a *PRESSURE* type  
 1126 *DataItem*.

1127 While a *Sensor* may be modeled in the XML document in different ways, it will always be  
 1128 modeled to associate the information measured by each *sensor element* with the *Structural  
 1129 Element* to which the measured value is most closely associated.

1130 

### 9.1 Sensor Data

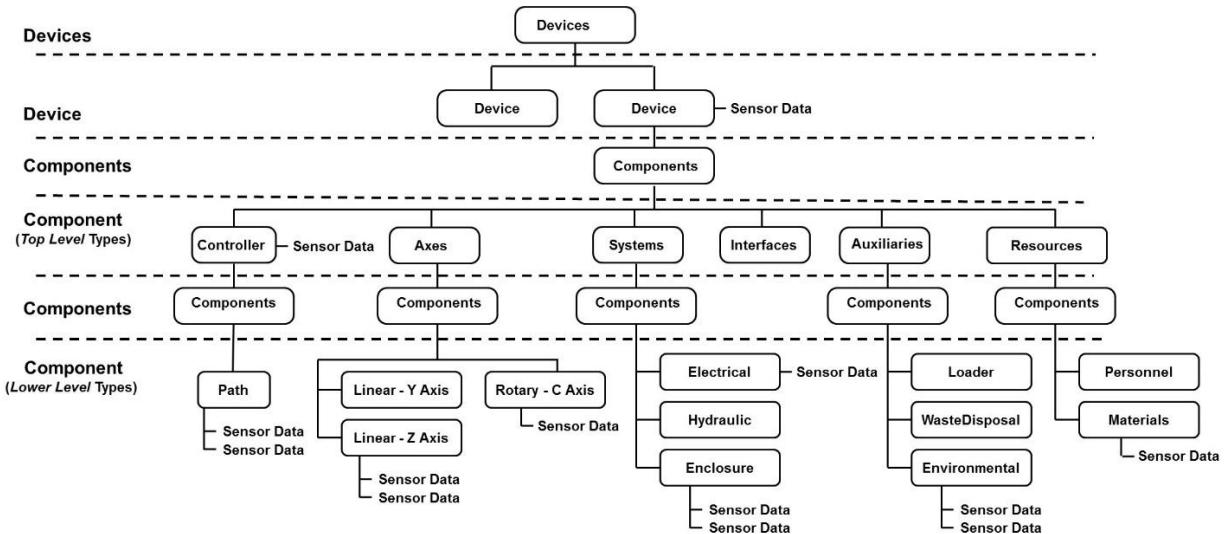

1131 The most basic implementation of a sensor occurs when the *sensing element* itself is not  
 1132 identified in the data model, but the data that is measured by the *sensing element* is provided as a  
 1133 data item associated with a *Component*. An example would be the measured value of the  
 1134 temperature of a spindle motor. This would be represented as a *DataItem* called  
 1135 *TEMPERATURE* that is associated with the *Rotary* type axis element called “C” as follows:

```
1136 1.  <Components>
1137 2.   <Axes
1138 3.     <Components>
1139 4.       <Rotary id="c" name="C">
1140 5.         <DataItems>
1141 6.           <DataItem type="TEMPERATURE" id="ctemp" category="SAMPLE"
1142 7.             name="Stemp" units="DEGREE"/>
1143 8.         </DataItems>
1144 9.       </Rotary>
1145 10.     </Components>
1146 11.   </Axes>
1147 12. </Components>
```

1148

1149 A sensor may measure values associated with any Component or Device element. Some  
1150 examples of how sensor data may be modeled are represented in *Figure 12* below:

1151

1152

**Figure 20: Sensor Data Associations**

1154

## 1155 9.2 Sensor Unit

1156 A *sensor unit* is an intelligent piece of equipment that manages the functions of one or more  
1157 *sensing elements*.

1158 Typical functions of the *sensor unit* include:

- convert low level signals from the *sensing elements* into data that can be used by other pieces of equipment. (Example: Convert a non-linear millivolt signal from a temperature sensor into a scaled temperature value that can be transmitted to another piece of equipment.)
  - process *sensing element* data into calculated values. (Example: temperature sensor data is converted into calculated values of average temperature, maximum temperature, minimum temperature, etc.)
  - provide calibration and configuration information associated with each *sensing element*
  - monitor the health and integrity of the *sensing elements* and the *sensor unit*. (Example: The *sensor unit* may provide diagnostics on each *sensing element* (e.g., open wire detection) and itself (e.g., measure internal temperature of the *sensor unit*).

Depending on how the *sensor unit* is used, it may be considered as either an independent piece of equipment and modeled in the XML document as a `Device`, or it may be modeled as a *Lower Level Component* called `Sensor` if it is integral to a piece of equipment.

1174 A Sensor **MAY** have its own uuid so it can be tracked throughout its lifetime.

1175 The following examples demonstrate how a *Sensor* may be modeled in the XML document  
1176 differently based on how the *Sensor* functions within the overall piece of equipment.

1177 Example#1: If the *Sensor* provides vibration measurement data for the spindle on a piece of  
1178 equipment, it could be modeled as a Sensor for rotary axis named C.

1179

```

1180 1.   <Components>
1181 2.     <Axes>
1182 3.       <Components>
1183 4.         <Rotary id="c" name="C">
1184 5.           <Components>
1185 6.             <Sensor id="spdlm" name="Spindlemonitor">
1186 7.               <DataItems>
1187 8.                 <DataItem type="DISPLACEMENT" id="cvib"
1188 9.                   category="SAMPLE" name="Svib" units="MILLIMETER"/>
1189 10.            </DataItems>
1190 11.          </Sensor >
1191 12.        <Components>
1192 13.          </Rotary>
1193 14.        </Components>
1194 15.      </Axes>
1195 16.    </Components>
```

1196

1197 Example#2: If a *Sensor* provides measurement data for multiple Component elements within  
1198 a piece of equipment and is not associated with any particular Component element, it **MAY** be  
1199 modeled in the XML document as an independent *Lower Level Component* and the data  
1200 associated with measurements are associated with their associated Component elements.

1201

1202

1203 This example represents a *sensor unit* with two *sensing elements*, one measures spindle vibration  
 1204 and the other measures the temperature for the X axis. The *sensor unit* also has a *sensing*  
 1205 *element* measuring the internal temperature of the *sensor unit*.

```

29.            </Axes>
30.          </Components>
31.        </Device>
```

1237

### 1238 9.3 Sensor Configuration

1239 When a *Sensor unit* is modeled in the XML document as a Component or as a separate piece of  
 1240 equipment, it may provide additional configuration information for the *sensor elements* and the  
 1241 *sensor unit* itself.

1242 Configuration data provides information required for maintenance and support of the sensor.

1243 Configuration data is *only* available when the *Sensor unit* is modeled as a Component or a  
 1244 separate piece of equipment. For details on the modeling of configuration data in the XML  
 1245 document, see *Section 4.4.3.2 Configuration for Component*. Details specific to  
 1246 *SensorConfiguration* are provided below.

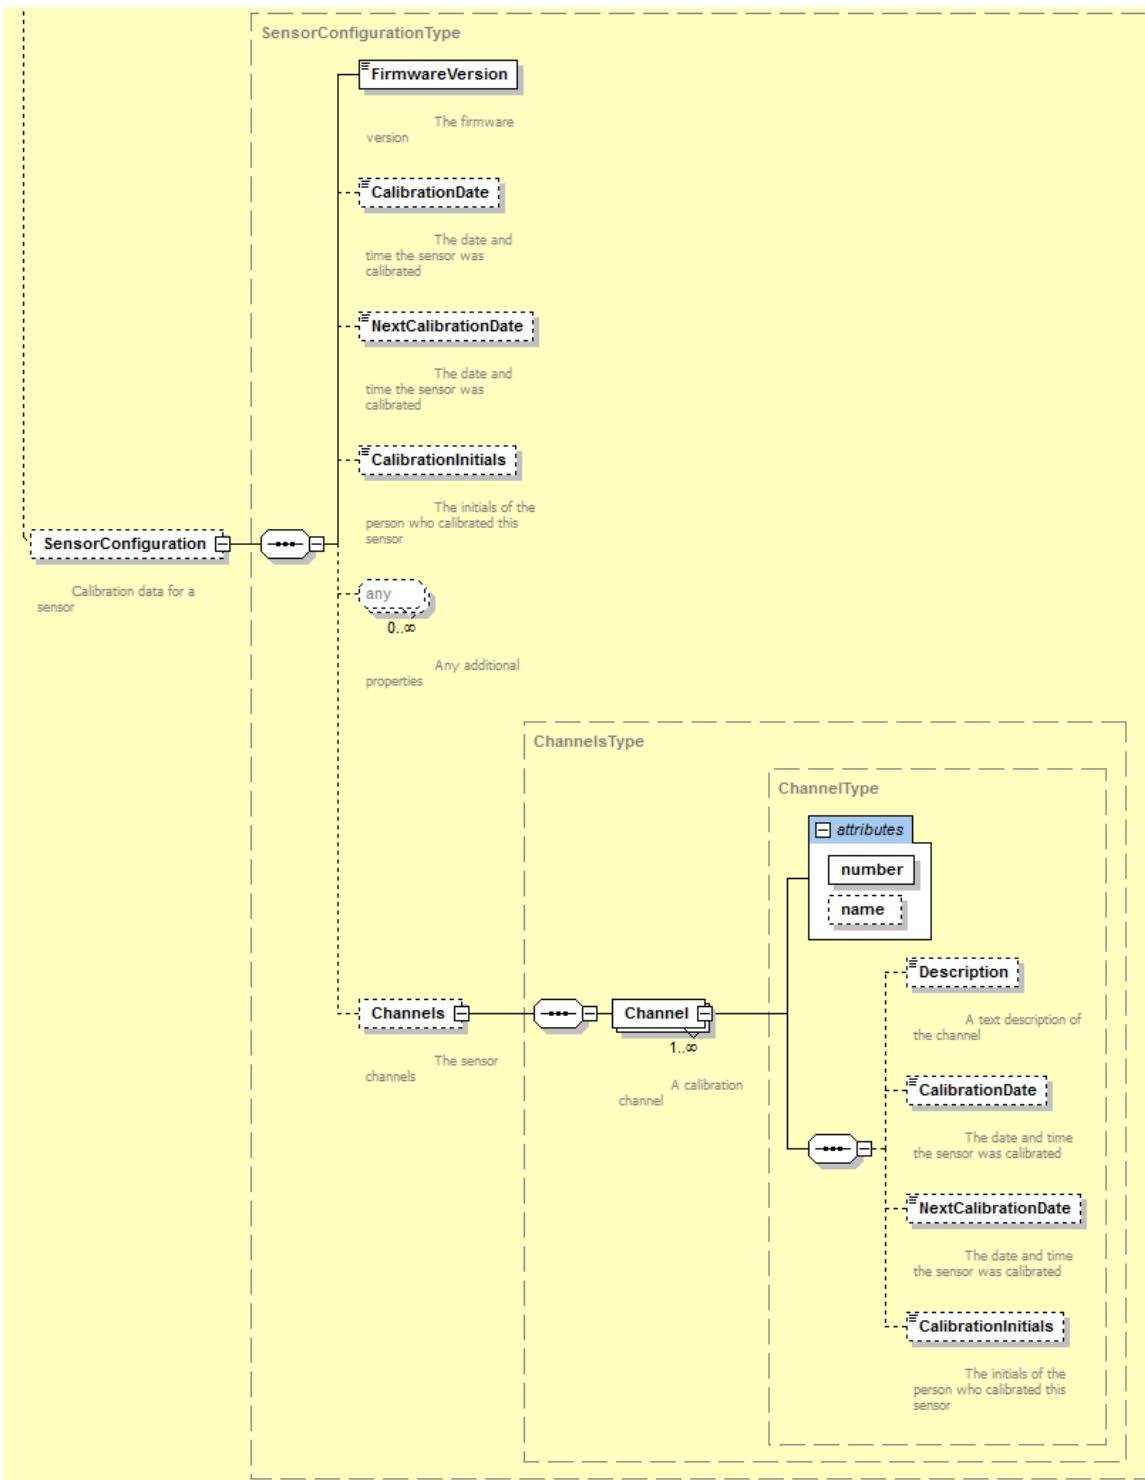

1247

1248 When Sensor represents the *sensor unit* for multiple *sensing element(s)*, each *sensing element*  
1249 is represented by a Channel. The sensor unit itself and each Channel representing one  
1250 *sensing element* **MAY** have its own configuration data.

1251 SensorConfiguration can contain any descriptive content for a *sensor unit*. This element  
1252 is defined to contain mixed content and additional XML elements (indicated by the any element  
1253 in the schema below) **MAY** be added to extend the schema for SensorConfiguration.

1254

- 1255 The following XML schema represents the structure of the SensorConfiguration XML  
 1256 element showing the attributes defined for SensorConfiguration.

1257  
 1258  
 1259  
 1260

**Figure 21: SensorConfiguration Schema Diagram**

Element	Description	Occurrence
SensorConfiguration	<p>An element that can contain descriptive content defining the configuration information for <code>Sensor</code>.</p> <p>For <code>Sensor</code>, the valid configuration is <code>SensorConfiguration</code> which provides data from a subset of items commonly found in a transducer electronic data sheet for sensors and actuators called TEDS.</p> <p>TEDS formats are defined in IEEE 1451.0 and 1451.4 transducer interface standards (ref 15 and 16, respectively).</p> <p>MTConnect does not support all of the data represented in the TEDS data, nor does it duplicate the function of the TEDS data sheets.</p>	0..1

1261

### 1262 9.3.1 Elements for `SensorConfiguration`

1263 The following table defines the configuration elements available for  
 1264 `SensorConfiguration`:

1265

Element	Description	Occurrence
FirmwareVersion	<p>Version number for the <i>sensor unit</i> as specified by the manufacturer.</p> <p><code>FirmwareVersion</code> is a required element if <code>SensorConfiguration</code> is used.</p> <p>The data value for <code>FirmwareVersion</code> is provided in the CDATA for this element and <b>MAY</b> be any numeric or text content.</p>	1
CalibrationDate	<p>Date upon which the <i>sensor unit</i> was last calibrated.</p> <p>The data value for <code>CalibrationDate</code> is provided in the CDATA for this element and <b>MUST</b> be represented in the W3C ISO 8601 format.</p>	0..1
NextCalibrationDate	<p>Date upon which the <i>sensor unit</i> is next scheduled to be calibrated.</p> <p>The data value for <code>NextCalibrationDate</code> is provided in the CDATA for this element and <b>MUST</b> be represented in the W3C ISO 8601 format.</p>	0..1

Element	Description	Occurrence
CalibrationInitials	<p>The initials of the person verifying the validity of the calibration data.</p> <p>The data value for <code>CalibrationInitials</code> is provided in the CDATA for this element and <b>MAY</b> be any numeric or text content.</p>	0..1
Channels	<p>When <code>Sensor</code> represents multiple <i>sensing elements</i>, each <i>sensing element</i> is represented by a <code>Channel</code> for the <code>Sensor</code>.</p> <p><code>Channels</code> is an XML container used to organize information for the <i>sensing elements</i>.</p>	0..1

1266

1267 **9.3.1.1 Attributes for Channel**1268 Channel represents each *sensing element* connected to a *sensor unit*. The table below defines  
1269 the attributes for Channel:

Attribute	Description	Occurrence
number	<p>A unique identifier that will only refer to a specific <i>sensing element</i>. <code>number</code> is a required attribute.</p> <p>For example, this can be the manufacturer code and the serial number.</p> <p><code>number</code> <b>SHOULD</b> be alphanumeric and not exceeding 255 characters.</p> <p>An NMTOKEN XML type.</p>	1
name	<p>The name of the <i>sensing element</i>. <code>name</code> is an optional attribute.</p> <p><code>name</code> <b>SHOULD</b> be unique within the <i>sensor unit</i> to allow for easier data integration.</p> <p>An NMTOKEN XML type.</p>	0..1

1270

1271

1272 **9.3.1.2 Elements for Channel**

1273 The following table describes the elements provided for Channel.

1274

Element	Description	Occurrence
Description	<p>An XML element that can contain any descriptive content.</p> <p>The CDATA of Description <b>MAY</b> include any additional descriptive information the implementer chooses to include regarding a <i>sensor element</i>.</p>	0..1
CalibrationDate	<p>Date upon which the <i>sensor unit</i> was last calibrated to the <i>sensor element</i></p> <p>The data value for CalibrationDate is provided in the CDATA for this element and <b>MUST</b> be represented in the W3C ISO 8601 format.</p>	0..1
NextCalibrationDate	<p>Date upon which the <i>sensor element</i> is next scheduled to be calibrated with the <i>sensor unit</i>.</p> <p>The data value for NextCalibrationDate is provided in the CDATA for this element and <b>MUST</b> be represented in the W3C ISO 8601 format.</p>	0..1
CalibrationInitials	<p>The initials of the person verifying the validity of the calibration data</p> <p>The data value for CalibrationInitials is provided in the CDATA for this element and <b>MAY</b> be any numeric or text content.</p>	0..1

1275

1276

1277 The following is an example of the configuration data for Sensor that is modeled as a  
1278 Component. It has Configuration data for the *sensor unit*, one Channel named A/D:1,  
1279 and two DataItems – Voltage (as a SAMPLE) and Voltage (as a CONDITION or alarm).

1280

# MTConnect<sup>®</sup> Standard

## Part 3.0 – Streams Information Model

Version 1.4.0

Prepared for: MTConnect Institute

Prepared on: March 31, 2018

# MTConnect® Specification and Materials

AMT - The Association For Manufacturing Technology (“AMT”) owns the copyright in this MTConnect® Specification or Material. AMT grants to you a non-exclusive, non-transferable, revocable, non-sublicensable, fully-paid-up copyright license to reproduce, copy and redistribute this MTConnect Specification or Material, provided that you may only copy or redistribute the MTConnect Specification or Material in the form in which you received it, without modifications, and with all copyright notices and other notices and disclaimers contained in the MTConnect Specification or Material.

If you intend to adopt or implement an MTConnect Specification or Material in a product, whether hardware, software or firmware, which complies with an MTConnect Specification, you shall agree to the MTConnect Specification Implementer License Agreement (“Implementer License”) or to the MTConnect Intellectual Property Policy and Agreement (“IP Policy”). The Implementer License and IP Policy each sets forth the license terms and other terms of use for MTConnect Implementers to adopt or implement the MTConnect Specifications, including certain license rights covering necessary patent claims for that purpose. These materials can be found at [www.MTConnect.org](http://www.MTConnect.org) or by contacting [info@MTConnect.org](mailto:info@MTConnect.org)

MTConnect Institute and AMT have no responsibility to identify patents, patent claims or patent applications which may relate to or be required to implement a Specification, or to determine the legal validity or scope of any such patent claims brought to their attention. Each MTConnect Implementer is responsible for securing its own licenses or rights to any patent or other intellectual property rights that may be necessary for such use, and neither AMT nor MTConnect Institute have any obligation to secure any such rights.

This Material and all MTConnect Specifications and Materials are provided “as is” and MTConnect Institute and AMT, and each of their respective members, officers, affiliates, sponsors and agents, make no representation or warranty of any kind relating to these materials or to any implementation of the MTConnect Specifications or Materials in any product, including, without limitation, any expressed or implied warranty of non-infringement, merchantability, or fitness for particular purpose, or of the accuracy, reliability, or completeness of information contained herein. In no event shall MTConnect Institute or AMT be liable to any user or implementer of MTConnect Specifications or Materials for the cost of procuring substitute goods or services, lost profits, loss of use, loss of data or any incidental, consequential, indirect, special or punitive damages or other direct damages, whether under contract, tort, warranty or otherwise, arising in any way out of access, use or inability to use the MTConnect Specification or other MTConnect Materials, whether or not they had advance notice of the possibility of such damage.

## 1    1 Purpose of This Document

2    This document, *Part 3.0 - Streams Information Model* of the MTConnect® Standard, establishes  
3    the rules and terminology that describes the information returned by an *MTConnect Agent* from a  
4    piece of equipment. The *Streams Information Model* also defines, in *Section 3*, the structure for  
5    the XML documents that are returned from an *MTConnect Agent* in response to a Sample or  
6    Current request.

7    *Part 3.0 - Streams Information Model* is not a stand-alone document. This document is used in  
8    conjunction with *Part 1.0 – Overview and Functionality* which defines the fundamentals of the  
9    operation of the MTConnect Standard and *Part 2.0 – Devices Information Model* that defines the  
10   semantic model representing the information that may be returned from a piece of equipment.

11   Note: *Part 5 – Interfaces* provides details on extensions to the *Streams Information Model*  
12   required to describe the interactions between pieces of equipment.

13   In the MTConnect Standard, *equipment* represents any tangible property that is used in the  
14   operation of a manufacturing facility. Examples of *equipment* are machine tools, ovens, sensor  
15   units, workstations, software applications, and bar feeders.

16

17

18    **2 Terminology**

19    Refer to *Section 5 of Part 1.0 – Overview and Functionality* for a dictionary of terms, reserved  
20    language, and document conventions used in the MTConnect® Standard.

## 21    3 Streams Information Model

22    The *Streams Information Model* provides a representation of the data reported by a piece of  
 23    equipment used for a manufacturing process, or used for any other purpose. Additional  
 24    descriptive information associated with the reported data is defined in the  
 25    MTConnectDevices document, which is described in *Part 2.0 – Devices Information Model*.

26    Information defined in the *Streams Information Model* allows a software application to (1)  
 27    determine the value for *Data Entities* returned from a piece of equipment and (2) interpret the  
 28    data associated with those *Data Entities* with the same meaning, value, and context that it had at  
 29    its original source. To do this, the software application issues one of two HTTP requests to an  
 30    *MTConnect Agent* associated with a piece of equipment. They are:

- 31    • *sample*: Returns a designated number of time stamped *Data Entities* from an  
 32    *MTConnect Agent* associated with a piece of equipment; subject to any HTTP filtering  
 33    associated with the request. See *Section 8.3.3 of Part 1.0 – Overview and Functionality*  
 34    of the MTConnect Standard for details on the *sample* HTTP request.
- 35    • *current*: Returns a snapshot of either the most recent values or the values at a given  
 36    sequence number for all *Data Entities* associated with a piece of equipment from an  
 37    *MTConnect Agent*; subject to any HTTP filtering associated with the request. See  
 38    *Section 8.3.2 of Part 1.0 – Overview and Functionality* of the MTConnect Standard for  
 39    details on the *current* HTTP request.

40    An *MTConnect Agent* responds to either the *sample* or *current* HTTP request with an  
 41    MTConnectStreams XML document. This document contains information describing *Data*  
 42    *Entities* reported by an *MTConnect Agent* associated with a piece of equipment. A client  
 43    software application may correlate the information provided in the MTConnectStreams XML  
 44    document with the physical and logical structure for that piece of equipment defined in the  
 45    MTConnectDevices document to form a clear and unambiguous understanding of the  
 46    information provided. (See details on the structure for a piece of equipment described in *Part*  
 47    *2.0 – Devices Information Model*).

48    The MTConnectStreams XML document is comprised of two sections: Header and  
 49    Streams .

50    The Header section contains protocol related information as defined in *Section 6.5 of Part 1.0*  
 51    – *Overview and Functionality* of the MTConnect Standard.

52    The Streams section of the MTConnectStreams document contains a DeviceStream  
 53    XML container for each piece of equipment represented in the document. Each  
 54    DeviceStream container is comprised of two primary types of XML elements – *Structural*  
 55    *Elements* and *Data Entities*. The contents of the DeviceStream container are described in  
 56    detail in this document, *Part 3.0* of the MTConnect Standard.

57

58     *Structural Elements* are defined for both the MTConnectDevices and the  
59     MTConnectStreams XML documents. These *Structural Elements* are used to provide a  
60     logical organization of the information provided in each document. While used for a similar  
61     purpose, the *Structural Elements* in the MTConnectStreams document are specifically  
62     designed to be distinctly different from those in the MTConnectDevices document:

- 63         • MTConnectDevices document: *Structural Elements* organize information that  
64             represents the physical and logical parts and sub-parts of a piece of equipment. (See *Part*  
65             *2.0 – Devices Information Model, Section 4* of the MTConnect Standard for more details  
66             on *Structural Elements* used in the MTConnectDevices document).
- 67         • MTConnectStreams document: *Structural Elements* provide the structure to organize  
68             the data returned from a piece of equipment and establishes the proper context for that  
69             data. The *Structural Elements* specifically defined for use in the MTConnectStreams  
70             document are DeviceStream (described in *Section 4.2* of this document) and  
71             ComponentStream (described in *Section 4.3* of this document).

72     DeviceStream and ComponentStream elements have a direct correlation to each  
73     of the *Structural Elements* defined in the MTConnectDevices document.

74     *Data Entities* that describe data reported by a piece of equipment are also defined for both the  
75     MTConnectDevices and the MTConnectStreams XML documents. The *Data Entities*  
76     provided in both documents directly relate to each other. However, *Data Entities* are used for  
77     different purposes in each document:

- 78         • MTConnectDevices document: *Data Entity* elements define the data that may be  
79             returned from a piece of equipment. *Part 2.0 – Devices Information Model, Sections 7*  
80             *and 8* lists the possible *Data Entity* XML elements that can be returned in a  
81             MTConnectDevices document.
- 82         • MTConnectStreams document: *Data Entity* elements provide the data reported by a  
83             piece of equipment. This data is organized in separate ComponentStream XML  
84             containers for each of the *Structural Elements* defined in the MTConnectDevices  
85             document associated with the data that is reported by a piece of equipment.

86     Within each ComponentStream XML container in the MTConnectStreams document,  
87     *Data Entities* are organized into three types of XML container elements - Samples, Events,  
88     and Condition. (Refer to *Sections 5 and 6* of this document for more information on these  
89     elements.)

## 90    4 Structural Elements for MTConnectStreams

91    *Structural Elements* are XML elements that form the logical structure for the  
92    MTConnectStreams XML document. These elements are used to organize the information  
93    and data that is reported by an *MTConnect Agent* for a piece of equipment. Refer to *Figure 1*  
94    below for an overview of the *Structural Elements* used in an MTConnectStreams document.

95    The first, or highest level, *Structural Element* in an MTConnectStreams XML document is  
96    Streams . Streams is a container type XML element used to group the data reported from  
97    one or more pieces of equipment into a single XML document. Streams **MUST** always appear  
98    in the MTConnectStreams document.

99    DeviceStream is the next *Structural Element* in the MTConnectStreams document.  
100   DeviceStream is also a XML container type element. A separate DeviceStream  
101   container is used to organize the information and data reported by each piece of equipment  
102   represented in the MTConnectStreams document. There **MUST** be at least one  
103   DeviceStream element in the Streams container.

104   A DeviceStream element provides the data reported by a piece of equipment. Each  
105   DeviceStream element **MUST** contain the attributes name and uuid to correlate the  
106   DeviceStream with a specific Device defined in the MTConnectDevices document.  
107   Once the DeviceStream element is associated with a specific piece of equipment based on  
108   this identity, all data reported by that piece of equipment is directly associated with that unique  
109   identity and that association does not need to be repeated for every piece of data reported. A  
110   client software application may then directly relate the information provided in the  
111   MTConnectDevices document with the data provided in the MTConnectStreams  
112   document based on this identity.

113   ComponentStream is the next level XML element in the MTConnectStreams document.  
114   ComponentStream is also a container type XML element. There **MUST** be a separate  
115   ComponentStream XML element for each of the *Structural Elements* (Device elements,  
116   *Top Level* Component elements, or *Lower Level* Component elements) defined for that piece  
117   of equipment in the associated MTConnectDevices XML document. A  
118   ComponentStream representing a *Structural Element* will only appear if there is data reported  
119   for that *Structural Element*. (Note: See *Part 2.0 – Devices Information Model* of the  
120   MTConnect Standard for a description of the *Structural Elements* for a piece of equipment).

121

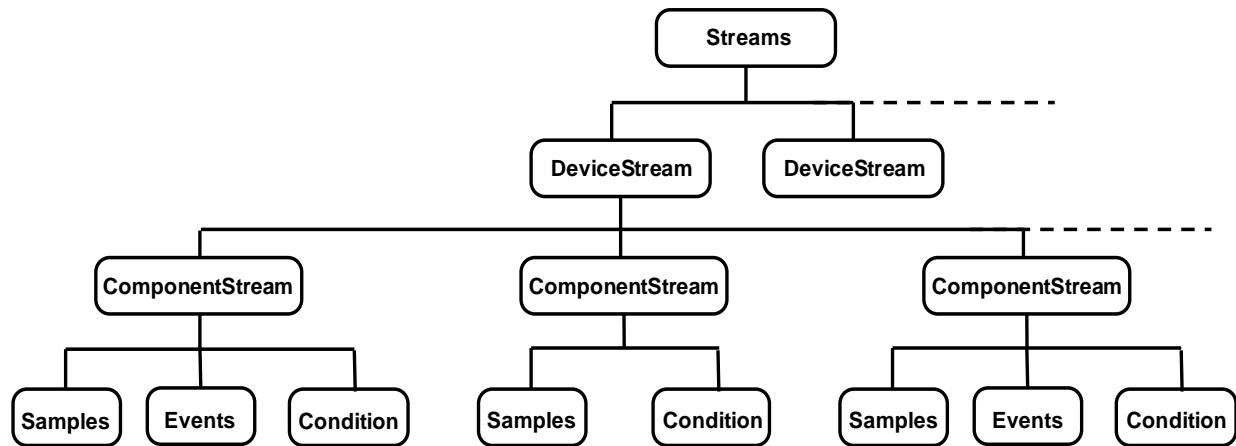

122 There are three (3) *Structural Elements* – Samples, Events, and Condition at the next  
 123 level of the MTConnectStreams document. Each one of these *Structural Elements* is a  
 124 container type XML element. These *Structural Elements* group the data reported for each  
 125 component of a piece of equipment according to the *Data Entity* categories defined in *Part 2.0 –*  
 126 *Devices Information Model, Sections 7 and 8*. Therefore,

- 127     • Samples contains SAMPLE category *Data Entities* defined in the  
 128        MTConnectDevices XML document (See *Part 2.0 – Devices Information Model,*  
 129        *Section 8.1*)
- 130     • Events contains EVENT category *Data Entities* defined in the MTConnectDevices  
 131        XML document (See *Part 2.0 – Devices Information Model, Section 8.2*)
- 132     • Condition contains CONDITION category *Data Entities* defined in the  
 133        MTConnectDevices XML document (See *Part 2.0 – Devices Information Model,*  
 134        *Section 8.3*)

135 There **MUST** be at least one of Samples, Events, or Condition elements in each  
 136 ComponentStream container.

137 The following XML tree structure illustrates the various *Structural Elements* used to organize the data  
 138 reported by a piece of equipment and the relationship between these elements.

139

140  
 141  
 142 **Figure 1: Streams Data Structure**

143

144

145 Below is a sample from an MTConnectStreams XML document that contains the response  
 146 from an *MTConnect Agent* representing two pieces of equipment, *mill-1* and *mill-2*. The data  
 147 from each piece of equipment is reported in a separate DeviceStream container.

```

148 1.   <MTConnectStreams ...>
149 2.     <Header ... />
150 3.     <Streams>
151 4.       <DeviceStream name="mill-1" uuid="1">
152 5.         <ComponentStream component="Device" name="mill-1"
153 6.           componentId="d1">
154 7.             <Events>
155 8.               <Availability dataItemId="avail1" name="avail" sequence="5"
156 9.                 timestamp="2010-04-06T06:19:35.153141">
157 10.                AVAILABLE</Availability>
158 11.             </Events>
159 12.           </ComponentStream>
160 13.         </DeviceStream>
161 14.       <DeviceStream name="mill-2" uuid="2">
162 15.         <ComponentStream component="Device" name="mill-2"
163 16.           componentId="d2">
164 17.             <Events>
165 18.               <Availability dataItemId="avail2" name="avail" sequence="15"
166 19.                 timestamp="2010-04-06T06:19:35.153141">
167 20.                AVAILABLE</Availability>
168 21.             </Events>
169 22.           </ComponentStream>
170 23.         </DeviceStream>
171 24.       </Streams>
172 25.     </MTConnectStreams>
```

173

174 In the example above, it should be noted that the *sequence numbers* are unique across the two  
 175 pieces of equipment. Client software applications **MUST NOT** assume that the Events and  
 176 Samples sequence numbers are strictly in sequence. All sequence numbers **MAY NOT** be  
 177 included. For instance, such a case would occur when HTTP filtering is applied to the request  
 178 and the SAMPLE, EVENT, and CONDITION data types for other components are not returned.  
 179 Another case would occur when an *MTConnect Agent* is supporting more than one piece of  
 180 equipment and data from only one piece of equipment is requested. Refer to MTConnect  
 181 Standard Part 1.0 – *Overview and Functionality*, Section 5: *MTConnect Fundamentals* for more  
 182 information on *sequence numbers*.

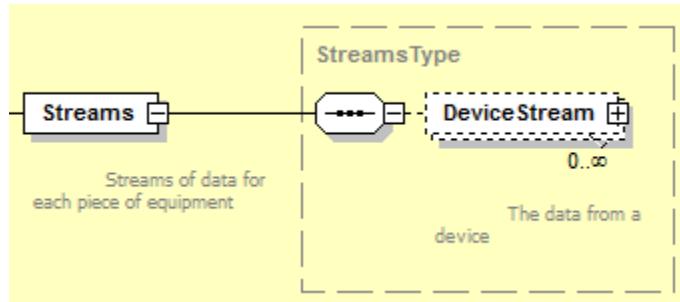

183

184 

## 4.1 Streams

185 Streams is a container type XML element that **MUST** contain only DeviceStream  
 186 elements. Streams **MAY** contain any number of DeviceStream elements. If there is no  
 187 data to be reported for a request for data, an MTConnectStreams document **MUST** be  
 188 returned with an empty Streams container. *Data Entities* **MAY NOT** be directly associated  
 189 with the Streams container.

190 The following XML schema represents the structure of the Streams XML element.

191

192 **Figure 2: Streams Schema Diagram**

193

Element	Description	Occurrence
Streams	<p>The first, or highest, level XML container element in an <i>MTConnectStreams Response Document</i> provided by an <i>MTConnect Agent</i> in response to a sample or current <i>HTTP Request</i>.</p> <p>There <b>MAY</b> be only one Streams element in an <i>MTConnectStreams Response Document</i> for each piece of equipment represented in the document.</p> <p>An empty Streams container <b>MAY</b> be provided to indicate that no data is available for the given <i>Request</i>.</p> <p>The Streams element <b>MAY</b> contain any number of DeviceStream elements, one for each piece of equipment represented in the MTConnectStreams document.</p>	1

194

195

196 **4.2 DeviceStream**

197 DeviceStream is a XML container that organizes data reported from a single piece of  
 198 equipment. A DeviceStream element **MUST** be provided for *each* piece of equipment  
 199 reporting data in an MTConnectStreams document.

200 A DeviceStream **MAY** contain any number of ComponentStream elements; limited to  
 201 one for each component element represented in the MTConnectDevices document. If the  
 202 response to the request for data from an *MTConnect Agent* does not contain any data for a  
 203 specific piece of equipment, an empty DeviceStream element **MAY** be created to indicate  
 204 that the piece of equipment exists, but there was no data available. In this case, there will be no  
 205 ComponentStream elements provided.

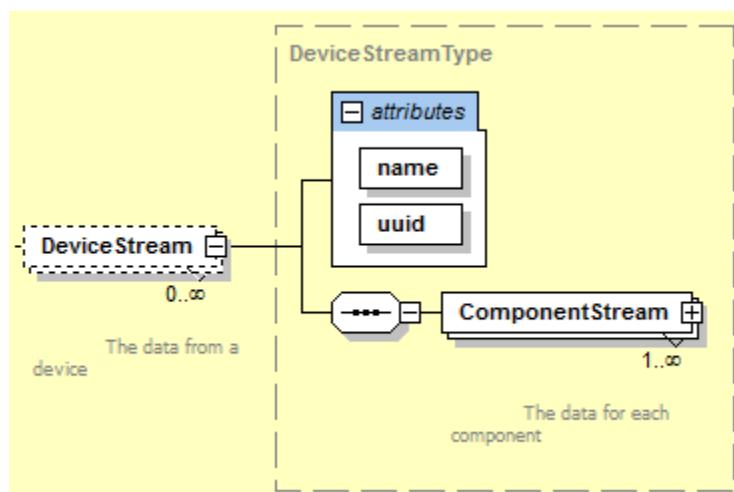

Element	Description	Occurrence
DeviceStream	A XML container element provided in the Streams container in the MTConnectStreams document.  There <b>MAY</b> be one or more DeviceStream elements in a Streams container; one for each piece of equipment represented in the MTConnectStreams document.	0..INF

206

207 **4.2.1 XML Schema for DeviceStream**

208 The following XML schema represents the structure of the DeviceStream XML element  
 209 showing the attributes defined for DeviceStream and the elements that **MAY** be associated  
 210 with DeviceStream.

211

212

213 **Figure 3: DeviceStream Schema Diagram**

214

## 215 4.2.2 Attributes for DeviceStream

216 The following table defines the attributes that **MUST** be provided to uniquely identify each  
 217 specific piece of equipment associated with the information provided in each DeviceStream.

218

Attribute	Description	Occurrence
name	<p>The name associated with the piece of equipment reporting the data contained in this DeviceStream container.</p> <p>name is a required attribute.</p> <p>The value reported for name <b>MUST</b> be the same as the value defined for the name attribute of the same piece of equipment in the MTConnectDevices document.</p> <p>An NMTOKEN XML type.</p> <p><b>WARNING:</b> name may become an optional attribute in future versions of the MTConnect Standard.</p>	1
uuid	<p>The uuid associated with the piece of equipment reporting the data contained in this DeviceStream container.</p> <p>uuid is a required attribute.</p> <p>The value reported for uuid <b>MUST</b> be the same as the value defined for the uuid attribute of the same piece of equipment in the MTConnectDevices document.</p>	1

219

## 220 4.2.3 Elements for DeviceStream

221 The following table lists the XML element(s) that **MAY** be provided in the DeviceStream  
 222 XML element.

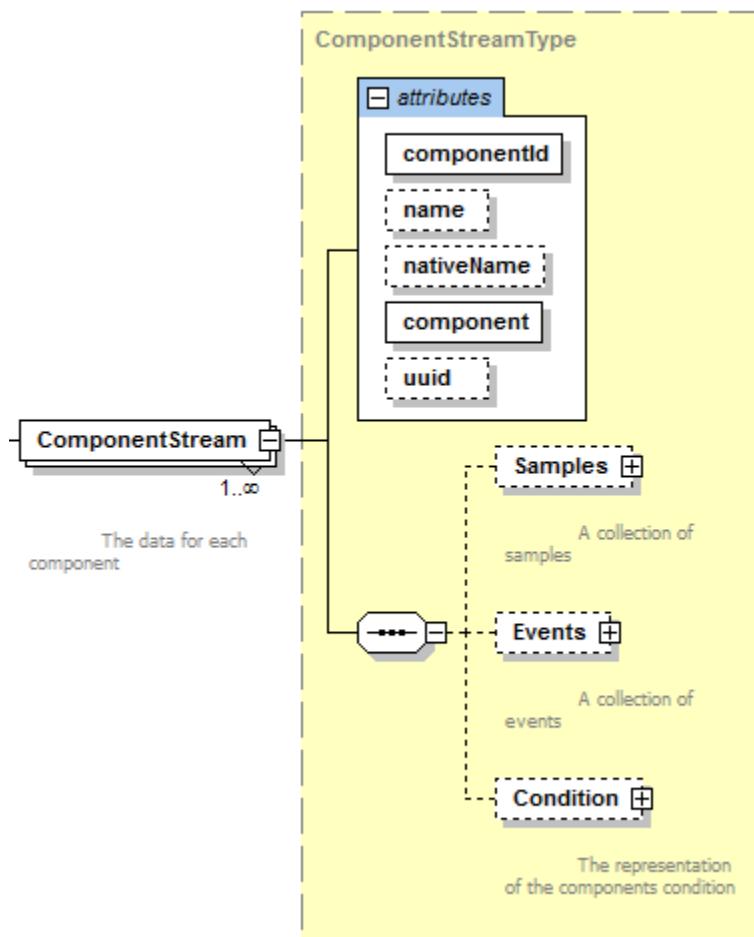

Element	Description	Occurrence
ComponentStream	<p>A XML container type element that organizes data returned from an <i>MTConnect Agent</i> in response to a current or sample HTTP request.</p> <p>Any number of ComponentStream elements <b>MAY</b> be provided in a DeviceStream container.</p> <p>There <b>MUST</b> be a separate ComponentStream XML element for each of the <i>Structural Elements</i> (Device elements, <i>Top Level</i> Component elements, or <i>Lower Level</i> Component elements) defined for that piece of equipment in the associated MTConnectDevices XML document. A ComponentStream representing a <i>Structural Element</i> will only appear if there is data reported for that <i>Structural Element</i>.</p>	0..INF

223 **4.3 ComponentStream**

224 ComponentStream is a XML container that organizes the data associated with each *Structural*  
 225 *Element* (Device element, *Top Level Component*, or *Lower Level Component* element)  
 226 defined for that piece of equipment in the associated MTConnectDevices XML document.  
 227 The data reported in each ComponentStream element **MUST** be grouped into individual  
 228 XML containers based on the value of the category attribute (SAMPLE, EVENT, or  
 229 CONDITION) defined for each *Data Entity* in the MTConnectDevices XML document.  
 230 These containers are Samples, Events, and Condition.

231 **4.3.1 XML Schema for ComponentStream**

232 The following XML schema represents the structure of a ComponentStream XML element  
 233 showing the attributes defined for ComponentStream and the elements that **MAY** be  
 234 associated with ComponentStream.

235

236 **Figure 4: ComponentStream Schema Diagram**

237

238 ComponentStream is similar to DeviceStream in that the attributes uniquely identify the  
 239 *Structural Element* with which the data reported is directly associated. This information does not  
 240 have to be repeated for each *Data Entity*. In the case of the DeviceStream, the attributes  
 241 uniquely identify the piece of equipment associated with the data. In the case of the  
 242 ComponentStream, the attributes identify the specific *Structural Element* within a piece of  
 243 equipment associated with each *Data Entity*.

#### 244 **4.3.2 Attributes for ComponentStream**

245 The following table defines the attributes used to uniquely identify the specific *Structural*  
 246 *Element(s)* of a piece of equipment associated with the data reported in the  
 247 MTConnectStreams document.

Attribute	Description	Occurrence
componentId	<p>The identifier of the <i>Structural Element</i> (Device element, <i>Top Level</i> Component element, or <i>Lower Level</i> Component element) as defined by the <i>id</i> attribute of the corresponding <i>Structural Element</i> in the MTConnectDevices XML document.</p> <p>componentId is a required attribute.</p> <p>The identifier <b>MUST</b> be the same as that defined in the MTConnectDevices document to associate the data reported in the ComponentStream container with the <i>Structural Element</i> identified in the MTConnectDevices document.</p>	1
name	<p>The name of the ComponentStream element.</p> <p>name is an optional attribute.</p> <p>If name is not defined for a specific <i>Structural Element</i> in the MTConnectDevices document, it <b>MUST NOT</b> be provided for the corresponding ComponentStream element in the MTConnectStreams document.</p> <p>If name is defined for a specific <i>Structural Element</i> in the MTConnectDevices document, it <b>MAY</b> be provided for the corresponding ComponentStream element in the MTConnectStreams document.</p> <p>If provided, the value reported for name <b>MUST</b> be the same as the value defined for the name attribute of the corresponding <i>Structural Element</i> (Device element, <i>Top Level</i> Component element, or <i>Lower Level</i> Component element) defined in the MTConnectDevices XML document.</p> <p>An NMTOKEN XML type.</p>	0..1

Attribute	Description	Occurrence
nativeName	<p>nativeName identifies the common name normally associated with the ComponentStream element.</p> <p>nativeName is an optional attribute.</p> <p>If nativeName is not defined for a specific <i>Structural Element</i> in the MTConnectDevices document, it <b>MUST NOT</b> be provided for the corresponding ComponentStream element in the MTConnectStreams document.</p> <p>If nativeName is defined for a specific <i>Structural Element</i> in the MTConnectDevices document, it <b>MAY</b> be provided for the corresponding ComponentStream element in the MTConnectStreams document.</p> <p>If provided, the value reported for nativeName <b>MUST</b> be the same as the value defined for the nativeName attribute of the corresponding <i>Structural Element</i> (Device element, <i>Top Level</i> Component element, or <i>Lower Level</i> Component element) defined in the MTConnectDevices XML document.</p>	0..1
component	<p>component identifies the <i>Structural Element</i> (Device, <i>Top Level</i> Component, or <i>Lower Level</i> Component) associated with the ComponentStream element.</p> <p>component is a required attribute.</p> <p>The value reported for component <b>MUST</b> be the same as the value defined for the <i>Element Name</i> of the XML container representing the corresponding <i>Structural Element</i> (Device element, <i>Top Level</i> Component element, or <i>Lower Level</i> Component element) defined in the MTConnectDevices XML document.</p> <p>Examples of component are Device, Axes, Controller, Linear, Electrical, User, and Loader.</p>	1

Attribute	Description	Occurrence
uuid	<p>uuid of the ComponentStream element.</p> <p>uuid is an optional attribute.</p> <p>If uuid is not defined for a specific <i>Structural Element</i> in the MTConnectDevices document, it <b>MUST NOT</b> be provided for the corresponding ComponentStream element in the MTConnectStreams document.</p> <p>If uuid is defined for a specific <i>Structural Element</i> in the MTConnectDevices document, it <b>MAY</b> be provided for the corresponding ComponentStream element in the MTConnectStreams document, but it is not required.</p> <p>If provided, the value reported for uuid <b>MUST</b> be the same as the value defined for the uuid attribute of the corresponding <i>Structural Element</i> (Device element, <i>Top Level</i> Component element, or <i>Lower Level</i> Component element) defined in the MTConnectDevices XML document.</p>	0..1

248

#### 249 4.3.3 Elements for ComponentStream

250 In the ComponentStream container, an *MTConnect Agent* **MUST** organize the data reported  
 251 in each ComponentStream into individual Samples, Events, or Condition XML  
 252 containers based on the value of the category attribute (i.e., SAMPLE, EVENT, or CONDITION)  
 253 defined for each *Data Entity* defined in the MTConnectDevices XML document.

254 Each ComponentStream element **MUST** include at least one Events, Samples, or  
 255 Condition XML container element. *Data Entities* returned in each of the  
 256 ComponentStream container elements are defined in the table below.

Element	Description	Occurrence
Samples	<p>A XML container type element.</p> <p>Samples organizes the SAMPLE type <i>Data Entities</i> defined in the MTConnectDevices document that are reported in each ComponentStream XML element.</p>	0..1 *
Events	<p>A XML container type element.</p> <p>Events organizes the EVENT type <i>Data Entities</i> defined in the MTConnectDevices document that are reported in each ComponentStream XML element.</p>	0..1 *

Element	Description	Occurrence
Condition	A XML container type element.  Condition organizes the CONDITION type <i>Data Entities</i> defined in the MTConnectDevices document that are reported in each ComponentStream XML element.	0..1 *

257

258      Note: \* The ComponentStream element **MUST** contain at least one of these element  
 259      types.

260

## 261 5 Data Entities

262 When a piece of equipment reports values associated with `DataItem` elements defined in the  
 263 `MTConnectDevices` document, that information is organized as *Data Entities* in the  
 264 `MTConnectStreams` document. These *Data Entities* are organized in containers within each  
 265 `ComponentStream` element based on the `category` attribute defined for the corresponding  
 266 `DataItem` in the `MTConnectDevices` document:

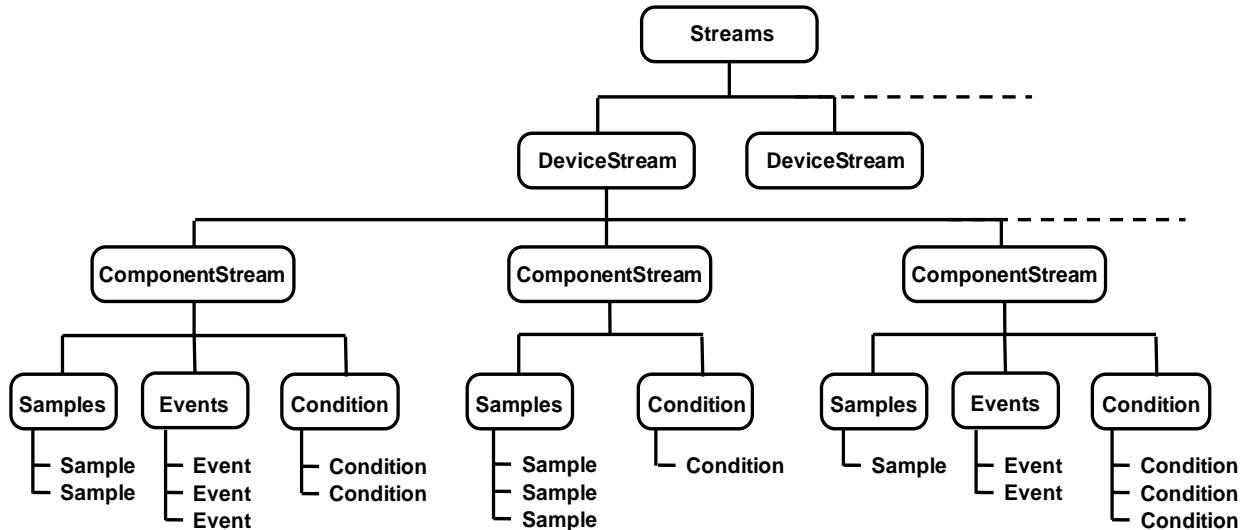

267 `DataItem` elements defined with a `category` attribute of `SAMPLE` in the  
 268 `MTConnectDevices` document are mapped to the `Samples` XML container in the  
 269 associated `ComponentStream` element.

270 `DataItem` elements defined with a `category` attribute of `EVENT` in the  
 271 `MTConnectDevices` document are mapped to the `Events` XML container in the  
 272 associated `ComponentStream` element.

273 `DataItem` elements defined with a `category` attribute of `CONDITION` in the  
 274 `MTConnectDevices` document are mapped to the `Condition` XML container in the  
 275 associated `ComponentStream` element.

276 The XML tree below demonstrates how *Data Entities* are organized in these containers.

277

278

279 **Figure 5: ComponentStream XML Tree Diagram**

280

281

282 The following is an illustration of the structure of an XML document demonstrating how *Data  
283 Entities* are reported in a MTConnectStreams document:

```

284 1.   <MTConnectStreams>
285 2.     <Header/>
286 3.     <Streams>
287 4.       <DeviceStream>
288 5.         <ComponentStream>
289 6.           <Samples>
290 7.             <Sample>
291 8.             <Sample>
292 9.             <Sample>
293 10.            </Samples>
294 11.            <Events>
295 12.              <Event>
296 13.              <Event>
297 14.            </Events>
298 15.            </Condition>
299 16.            <Condition>
300 17.            <Condition>
301 18.            </Condition>
302 19.        </ComponentStream>
303 20.        <ComponentStream>
304 21.          <Samples>
305 22.            <Sample>
306 23.            <Sample>
307 24.          </Samples>
308 25.          <Events>
309 26.            <Event>
310 27.            <Event>
311 28.            <Event>
312 29.          </Events>
313 30.          <Condition>
314 31.          <Condition>
315 32.          </Condition>
316 33.      </ComponentStream>
317 34.    </DeviceStream>
318 35.  </Streams>
319 36. </MTConnectStreams>
```

320

321 Note: There are no specific requirements defining the sequence in which the  
 322 ComponentStream XML elements are organized in the MTConnectStreams  
 323 document. They **MAY** be organized in any sequence based on the implementation of an  
 324 *MTConnect Agent*. The sequence in which the ComponentStream XML elements  
 325 appear does not impact the ability for a client software application to interpret the  
 326 information that it receives in the document.

327

328 When an *MTConnect Agent* responds to a *current* HTTP request, the information returned in  
329 the MTConnectStreams document **MUST** include the most current value for every *Data*  
330 *Entity* defined in the MTConnectDevices document subject to any filtering included within  
331 the request.

332 When an *MTConnect Agent* responds to a *sample* HTTP request, the information returned in  
333 the MTConnectStreams document **MUST** include the occurrences for each *Data Entity* that  
334 are available to an *MTConnect Agent* subject to filtering and the count parameter included within  
335 the request (see *Part 1 - Overview and Functionality* for a full definition of the protocol).

## 336 **5.1 Element Names for Data Entities**

337 In the MTConnectDevices document, *Data Entities* are grouped as *DataItem* XML  
338 elements within each *Device*, *Top Level Component*, and *Lower Level Component*  
339 *Structural Element*. The *Data Entities* reported in the MTConnectStreams document  
340 associated with each of these *Structural Elements* are represented with an *Element Name* based  
341 on the category and type defined for each of the *DataItem* elements in the  
342 MTConnectDevices document.

### 343 **5.1.1 Element Names when MTConnectDevices category is SAMPLE or** 344 **EVENT**

345 The *Data Entities* reported in the MTConnectStreams document associated with each  
346 *DataItem* element defined in the MTConnectDevices document with a category  
347 attribute of SAMPLE or EVENT **MUST** be identified in the MTConnectStreams document  
348 with an *Element Name* derived from the type attribute defined for that *DataItem* element in  
349 the MTConnectDevices document.

350

351 The example below describes the most common method used to derive the *Element Name* for a  
 352 *Data Entity* reported in the MTConnectStreams document from the information describing  
 353 that DataItem element in the MTConnectDevices document:

354 **DataItem Represented in the MTConnectDevices Document**

355 1. <DataItem type="AXIS\_FEEDRATE" id="xf" name="Xfrt"  
 356 2. category="SAMPLE" units="MILLIMETER/SECOND"  
 357 3. nativeUnits="MILLIMETER/SECOND"/>

- 358 • DataItem: The XML *Element Name* for this *Data Entity*.

359 Note: *Element Name* must not be confused with the name attribute for the data  
 360 item element.

- 361 • type, category, units, and nativeUnits: Attributes that provide  
 362 additional information regarding each data item in the MTConnectDevices  
 363 document.

364 **Response Format reported in the MTConnectStreams Document**

365 1. <AxisFeedrate name="Xfrt" sequence="61315517" timestamp="2016-07-  
 366 2. 28T02:06:01.364428Z" dataItemId="xf">10.83333</AxisFeedrate>

- 367 • AxisFeedrate: The *Element Name* provided in the MTConnectStreams  
 368 response format for the data item. The *Element Name* for a data item is defined by  
 369 the type attribute of AXIS\_FEEDRATE in the MTConnectDevices  
 370 document. The *Element Name* **MUST** be provided in Pascal case format (first  
 371 letter of each word is capitalized).

372 **5.1.2 Changes to *Element Names* when representation attribute is used**

373 The *Element Name* for a *Data Entity* reported in the MTConnectStreams document is  
 374 extended when the representation attribute is used to further describe that DataItem  
 375 element in the MTConnectDevices document.

376 When a DataItem element is defined in the MTConnectDevices document with a  
 377 representation attribute of TIME\_SERIES or DISCRETE, the XML *Element Name* for  
 378 the associated *Data Entity* reported in the MTConnectStreams document **MUST** be extended  
 379 by adding the value of the representation attribute to the *Element Name*.

380 For example, the DataItem element ANGULAR\_VELOCITY with a representation  
 381 attribute defined as TIME\_SERIES **MUST** be transformed to the *Element Name*  
 382 AngularVelocityTimeSeries.

383 Similarly, the DataItem element PART\_COUNT with a representation attribute defined  
 384 as DISCRETE **MUST** be transformed to the *Element Name* PartCountDiscrete.

### 385    5.1.3 ***Element Names*** when **MTConnectDevices** category is **CONDITION**

386    *Data Entities* defined in the **MTConnectDevices** document with a **category** attribute of  
 387    **CONDITION** are reported with an **Element Name** that is defined differently from other *Data*  
 388    *Entity* types. The **Element Name** for these *Data Entities* are defined based on the **Fault State**  
 389    (**Normal**, **Warning**, or **Fault**) associated with each *Data Entity* at the time that a value for  
 390    that *Data Entity* is reported. See *Sections 5.7.1 and 5.8* for details on how these *Data Entities* are  
 391    reported in the **MTConnectStreams** document.

## 392    5.2 **Samples Container**

393    Samples is a XML container type element. Samples organizes the *Data Entities* returned in  
 394    the **MTConnectStreams** XML document for those **DataItem** elements defined with a  
 395    **category** attribute of **SAMPLE** in the **MTConnectDevices** document.

396    A separate Samples container will be provided for the data returned for the **DataItem**  
 397    elements associated with each **Structural Element** of a piece of equipment defined in the  
 398    **MTConnectDevices** document.

399

Element	Description	Occurrence
Samples	<p>A XML container type element that organizes the data reported in the <b>MTConnectStreams</b> document for <b>DataItem</b> elements defined in the <b>MTConnectDevices</b> document with a <b>category</b> attribute of <b>SAMPLE</b>.</p> <p>A separate Samples container <b>MUST</b> be provided for each <b>ComponentStream</b> element for which data is returned for a <b>DataItem</b> element defined in the <b>MTConnectDevices</b> document with a <b>category</b> attribute of <b>SAMPLE</b>.</p> <p>If provided in the document, a Samples XML container <b>MUST</b> contain at least one Sample element.</p>	0..1

400

401

402    **5.3 Sample Data Entities**

403    A Sample XML element provides the information and data reported from a piece of equipment  
 404    for those DataItem elements defined with a category attribute of SAMPLE in the  
 405    MTConnectDevices document.

406    Sample is an abstract type XML element and will never appear directly in the  
 407    MTConnectStreams XML document. As an abstract type XML element, Sample will be  
 408    replaced in the XML document by a specific type of Sample specified by the *Element Name* for  
 409    that *Data Entity*. The different types of Sample elements are defined in *Section 6.1*. Examples  
 410    of XML elements representing Sample include PathPosition, Temperature, and  
 411    AxisVelocity.

Element	Description	Occurrence
Sample	<p>A XML element that provides the information and data reported from a piece of equipment for those DataItem elements defined with a category attribute of SAMPLE in the MTConnectDevices document.</p> <p>Sample is an abstract type XML element. It is replaced in the MTConnectStreams document by a specific type of Sample element.</p> <p>There <b>MAY</b> be multiple types of Sample elements in a Samples container.</p>	1..INF

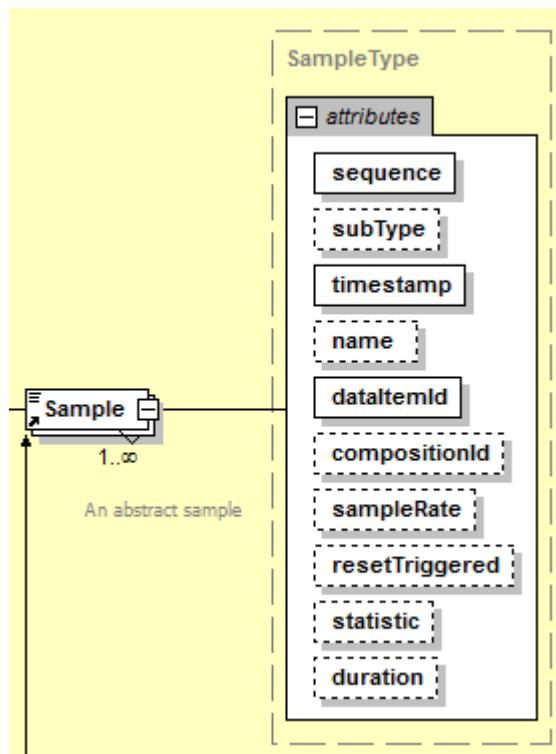

412

413

### 414 5.3.1 XML Schema Structure for Sample

415 The following XML schema represents the structure of a Sample XML element showing the  
416 attributes defined for Sample elements.

417

418

419 **Figure 6: Sample Schema Diagram**

420

## 421 5.3.2 Attributes for Sample

422 The following table defines the attributes used to provide additional information for a `Sample`  
 423 XML element.

424

Attribute	Description	Occurrence
<code>sequence</code>	A number representing the sequential position of an occurrence of the <code>Sample</code> in the data buffer of an <i>MTConnect Agent</i> .  <code>sequence</code> is a required attribute.  <code>sequence</code> <b>MUST</b> have a value represented as an unsigned 64-bit value from 1 to $2^{64}-1$ .	1
<code>subType</code>	The <code>subType</code> of the <i>Data Entity</i> .  <code>subType</code> is an optional attribute.  <code>subType</code> <b>MUST</b> match the <code>subType</code> attribute of the <code>DataItem</code> element as defined in the <code>MTConnectDevices</code> document that the <code>Sample</code> element represents.	0..1
<code>timestamp</code>	The most accurate time available to a piece of equipment that represents the point in time that the data reported for the <code>Sample</code> was measured.  When the <code>Sample</code> element represents a <code>DataItem</code> element defined in the <code>MTConnectDevices</code> document with a <code>representation</code> or <code>statistic</code> attribute, <code>timestamp</code> <b>MUST</b> represent the time that the data collection was completed.  <code>timestamp</code> is a required attribute.	1
<code>name</code>	The name of the <code>Sample</code> element.  <code>name</code> is an optional attribute.  <code>name</code> <b>MUST</b> match the <code>name</code> attribute of the <code>DataItem</code> element defined in the <code>MTConnectDevices</code> document that the <code>Sample</code> element represents.  An <code>NMTOKEN</code> XML type.	0..1
<code>dataItemId</code>	The unique identifier for the <code>Sample</code> element.  <code>dataItemId</code> is a required attribute.  <code>dataItemId</code> <b>MUST</b> match the <code>id</code> attribute of the <code>DataItem</code> element defined in the <code>MTConnectDevices</code> document that the <code>Sample</code> element represents.	1

Attribute	Description	Occurrence
sampleRate	<p>The rate at which successive samples of the value of a data item are recorded. <code>sampleRate</code> is expressed in terms of samples per second. <code>sampleRate</code> is an optional attribute.</p> <p>If the <code>sampleRate</code> is smaller than one, the number can be represented as a decimal type floating-point number. For example, a rate of 1 per 10 seconds would be 0.1</p> <p><code>sampleRate</code> <b>MUST</b> be provided when the <code>representation</code> attribute of the <code>DataItem</code> element defined in the <code>MTConnectDevices</code> document that this <code>Sample</code> element represents is <code>TIME_SERIES</code>.</p> <p>For <code>DataItem</code> elements where the <code>representation</code> attribute defined in the <code>MTConnectDevices</code> document that this <code>Sample</code> element represents is not <code>TIME_SERIES</code>, it <b>MUST</b> be assumed that the data reported is represented by a single value and <code>sampleRate</code> <b>MUST NOT</b> be reported in the <code>MTConnectStreams</code> document.</p>	0..1
statistic	<p>The type of statistical calculation defined by the <code>statistic</code> attribute of the <code>DataItem</code> element defined in the <code>MTConnectDevices</code> document that this <code>Sample</code> element represents.</p> <p><code>statistic</code> is an optional attribute.</p>	0..1
duration	<p>The time-period over which the data was collected.</p> <p><code>duration</code> is an optional attribute.</p> <p><code>duration</code> <b>MUST</b> be provided when the <code>statistic</code> attribute of the <code>DataItem</code> element is defined in the <code>MTConnectDevices</code> document that this <code>Sample</code> element represents.</p>	0..1
resetTriggered	<p>For those <code>DataItem</code> elements that report data that may be periodically reset to an initial value, <code>resetTriggered</code> identifies when a reported value has been reset and what has caused that reset to occur.</p> <p><code>resetTriggered</code> is an optional attribute.</p> <p><code>resetTriggered</code> <b>MUST</b> only be provided for the specific occurrence of a <code>Data Entity</code> reported in the <code>MTConnectStreams</code> document when the reset occurred and <b>MUST NOT</b> be provided for any other occurrence of the <code>Data Entity</code> reported in a <code>MTConnectStreams</code> document.</p>	0..1
compositionId	<p>The identifier of the <code>Composition</code> element defined in the <code>MTConnectDevices</code> document associated with the data reported for the <code>Sample</code> element.</p> <p><code>compositionId</code> is an optional attribute.</p>	0..1

425 **5.3.2.1 duration Attribute for Sample**

426 Sample elements that represent the result of a computed value of a statistic **MUST** contain  
 427 a duration attribute. For these *Data Entities*, the timestamp associated with the Sample  
 428 **MUST** reference the time the data collection was completed. timestamp **MUST NOT**  
 429 represent any other time associated with the data collection or the calculation of the statistic. The  
 430 actual time the interval began can be computed by subtracting the duration from the  
 431 timestamp.

432 Two Sample elements **MAY** have overlapping time periods when statistics are computed at  
 433 different frequencies. For example, there may be two *Data Entities* reporting a statistic  
 434 representing the average value for the readings of the same measured signal calculated over one  
 435 and five minute intervals. These *Data Entities* can both have the same start time for their  
 436 calculations (e.g., 05:10:00), but the timestamp and duration will be 05:11:00 and 60  
 437 seconds, respectively, for the *Data Entity* reporting the one-minute average and 05:15:00 and  
 438 300 seconds, respectively, for the *Data Entity* reporting the five-minute average. This allows for  
 439 varying statistical methods to be applied with different interval lengths each having different  
 440 values for the timestamp and duration attributes.

441 **5.3.2.2 resetTriggered Attribute for Sample**

442 Some *Data Entities* **MAY** have their reported value reset to an initial value. These reset actions  
 443 may be based upon a specific elapsed time or may be triggered by a physical or logical reset  
 444 action that causes the reset to occur. Examples of *Data Entities* that **MAY** have their reported  
 445 value reset to an initial value are *Data Entities* representing a counter, a timer, or a statistic.

446 resetTriggered defines the type of reset action that caused the value of the reported data to  
 447 be reset. The value reported for resetTriggered **MAY** be defined by the ResetTrigger  
 448 element for the *Data Entity* in the MTConnectDevices document that this Sample element  
 449 represents. If the ResetTrigger element is not defined in the MTConnectDevices  
 450 document, a resetTriggered attribute **SHOULD** be reported in the MTConnectStreams  
 451 document if the type of reset action can be determined and reported by the piece of equipment.

452 resetTriggered **MUST** only be reported for the first occurrence of a *Data Entity* after a  
 453 reset action has occurred and **MUST NOT** be provided for any other occurrence of the *Data*  
 454 *Entity* reported in a MTConnectStreams document. When a reset occurs, the piece of  
 455 equipment **MUST** report an occurrence of the *Data Entity* that was reset even if that occurrence  
 456 of the *Data Entity* would normally be suppressed based on the filtering criteria established in the  
 457 MTConnectDevices document that this Sample element represents.

458

459 The following table provides the values that **MAY** be reported for `resetTriggered`:

Value for <code>resetTriggered</code>	Description
ACTION_COMPLETE	The value of the <i>Data Entity</i> that is measuring an action or operation was reset upon completion of that action or operation.
ANNUAL	The value of the <i>Data Entity</i> was reset at the end of a 12-month period.
DAY	The value of the <i>Data Entity</i> was reset at the end of a 24-hour period.
MAINTENANCE	The value of the <i>Data Entity</i> was reset upon completion of a maintenance event.
MANUAL	The value of the <i>Data Entity</i> was reset based on a physical reset action.
MONTH	The value of the <i>Data Entity</i> was reset at the end of a monthly period.
POWER_ON	The value of the <i>Data Entity</i> was reset when power was applied to the piece of equipment after a planned or unplanned interruption of power has occurred.
SHIFT	The value of the <i>Data Entity</i> was reset at the end of a work shift.
WEEK	The value of the <i>Data Entity</i> was reset at the end of a 7-day period.

460

461

462   **5.3.3 Response for SAMPLE category DataItem Elements with a**  
463   **representation attribute of TIME\_SERIES**

464   SAMPLE category DataItem elements defined in the MTConnectDevices document with a  
465   representation attribute of TIME\_SERIES **MUST** be represented in the  
466   MTConnectStreams document as Sample elements that report data that includes multiple  
467   values representing a series of readings of a measured value taken at a specific sample rate.  
468   Such a DataItem element can be defined for collecting high frequency readings of a measured  
469   value and then providing the entire series of values to a client software application as the data  
470   reported for a single *Data Entity*. In this case, the sampleCount and sampleRate attributes  
471   **MUST** be provided.

472   Note: sampleCount is an attribute **MUST** only be provided for Sample elements that  
473   represent SAMPLE category DataItem elements defined in the  
474   MTConnectDevices document with a representation attribute of  
475   TIME\_SERIES.

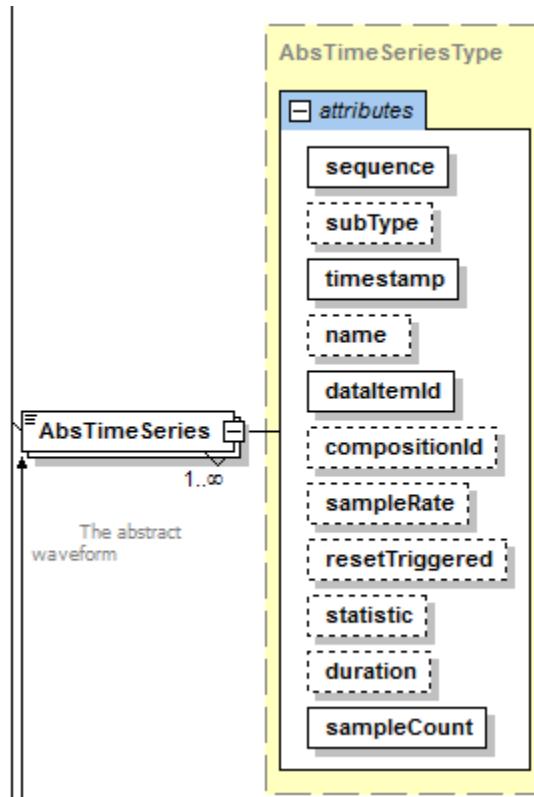

476   The CDATA provided for the *Data Entity* **MUST** be a series of space delimited floating-point  
477   numbers. The number of values **MUST** match the sampleCount.

478

479 **5.3.3.1 XML Schema Structure for Sample when reporting Time Series data**

480 The following XML schema represents the extended structure of a Sample XML element that  
 481 represents a SAMPLE category DataItem element defined in the MTConnectDevices  
 482 document with a representation attribute of TIME\_SERIES.

483

484

485 **Figure 7: AbsTimeSeries Schema Diagram**

486

487 Note: The AbsTimeSeries element shown in the XML schema is an abstract type element  
 488 and will be replaced in the MTConnectStreams document by the element name  
 489 derived from the type attribute defined for the associated DataItem element defined  
 490 in the MTConnectDevices document.

491

492    **5.3.3.2 Attributes for a Sample when reporting Time Series data**

493    The following table defines the additional attribute provided for a Sample XML element that  
 494    represents a SAMPLE category DataItem element defined in the MTConnectDevices  
 495    document with a representation attribute of TIME\_SERIES.

496

Attribute	Description	Occurrence
sampleCount	<p>The number of readings reported in the data returned for the DataItem element defined in the MTConnectDevices document that this Sample element represents.</p> <p>sampleCount is an optional attribute.</p> <p>sampleCount <b>MUST</b> be provided when the representation attribute of the DataItem element is TIME_SERIES.</p> <p>sampleCount <b>MUST NOT</b> be provided when the representation attribute is defined as DISCRETE or VALUE, or when it is not defined.</p>	0..1

497

498    **5.3.4 Valid Data Values for Sample**

499    All Sample elements reported in an MTConnectStreams XML document **MUST** provide a  
 500    value in the CDATA of the *Data Entity*.

501    The value returned in the CDATA **MUST** be reported as either a *Valid Data Value* representing  
 502    the information reported from a piece of equipment or UNAVAILABLE when a *Valid Data Value*  
 503    cannot be determined.

504    The *Valid Data Value* reported for a Sample represents the reading of the value of a  
 505    continuously variable or analog data source.

506    The representation attribute for a SAMPLE category DataItem element defined in the  
 507    MTConnectDevices document specifies how an *MTConnect Agent* **MUST** record instances  
 508    of the data associated with that data item and how often that data **MUST** be reported as a  
 509    Sample element in the MTConnectStreams document.

510

511 The data reported for a `Sample` element associated with a `SAMPLE` category `DataItem`  
 512 element with a representation of `VALUE` can be measured at any point-in-time and **MUST**  
 513 always produce a result with a single data value.

514 Note: If a `representation` attribute is not specified in the `MTConnectDevices`  
 515 document for a `DataItem` element, it **MUST** be assumed that the data reported in the  
 516 `MTConnectStreams` document for the *Data Entity* has a representation type  
 517 of `VALUE`.

518 In the case of a `Sample` element associated with a `SAMPLE` category `Data`  
 519 `Item` element with a `representation` attribute of `TIME_SERIES`, the data provided  
 520 **MUST** be a series of data values representing multiple sequential samples of the measured value  
 521 that will be provided only at the end of the completion of a sampling period. (See *Section 5.3.3*  
 522 of this document for more information on `TIME_SERIES` type data).

523 Data values provided for a `Sample` **MUST** always be a floating-point number. In the  
 524 `MTConnect Standard`, floating-point numbers are defined as XML `xs:float` type numbers as  
 525 defined by W3C. Any of the following number formats are valid XML floating type numbers:  
 526 1267.43233E12, -1E4, 12.78e-2, 12, 137.2847, 0, and INF.

527 Note: For some `Sample` elements, the *Valid Data Value* **MAY** be restricted to specific  
 528 formats. See *Section 6.1* of this document for a description of any restrictions of the  
 529 acceptable format for *Valid Data Values*.

530 For `Sample` elements, a client software application can determine the appropriate accuracy of  
 531 the value reported for the *Data Entity* by applying the `significantDigits` attribute defined  
 532 for the corresponding `DataItem` element defined in the `MTConnectDevices` document.

533 The *Valid Data Value* reported as CDATA for a `Sample` element **MUST** be formatted as part of  
 534 the content between the element tags in the XML element representing that *Data Entity*. As an  
 535 example, a `Position` is formatted as follows in the XML document:

536 1. <`Position sequence="112" timestamp="2007-08-09T12:32:45.123Z"`  
 537 2. &nbsp;&nbsp;&nbsp;&gt;`name="Xabs" dataItemId="10">123.3333</Position>`

538 Note: The **BOLDED** item is identified for emphasis only.

539 In this example, the 123.3333 is the CDATA for `Position`. All CDATA in a `Sample` element is  
 540 *typed*, which means that the value reported for the *Data Entity* **MUST** be formatted as defined in *Section*  
 541 *6.1* for each *Data Entity* so that it can be validated.

542

543 **5.3.5 Unavailability of *Valid Data Values* for Sample**

544 If an *MTConnect Agent* cannot determine a *Valid Data Value* for a *Sample* element, the value  
 545 returned for the CDATA for the *Data Entity* **MUST** be reported as UNAVAILABLE.

546 The example below demonstrates how an *MTConnect Agent* reports the value for a *Sample* in  
 547 the CDATA when it is unable to determine a *Valid Data Value*:

```
548 1. <Samples>
549 2.   <PathPosition dataItemId="p2" timestamp="2009-03-04T19:45:50.458305"
550 3.     subType="ACTUAL" name="Zact"
551 4.     sequence="15065113">UNAVAILABLE</PathPosition>
552 5.   <Temperature dataItemId="t6"
553 6.     timestamp="2009-03-04T19:45:50.458305"
554 7.     name="temp" sequence="150651134">UNAVAILABLE</Temperature>
555 8. </Samples>
```

556

557 Note: The **BOLDED** items are identified for emphasis only.

558 **5.4 Events Container**

559 *Events* is a XML container type element. *Events* organizes the *Data Entities* returned in the  
 560 *MTConnectStreams* XML document for those *DataItem* elements defined with a  
 561 category attribute of EVENT in the *MTConnectDevices* document.

562 A separate *Events* container will be provided for the data returned for the *DataItem* elements  
 563 associated with each *Structural Element* of a piece of equipment defined in the  
 564 *MTConnectDevices* document.

565

Element	Description	Occurrence
Events	<p>A XML container type element that organizes the data reported in the <i>MTConnectStreams</i> document for <i>DataItem</i> elements defined in the <i>MTConnectDevices</i> document with a category attribute of EVENT.</p> <p>A separate <i>Events</i> container <b>MUST</b> be provided for each <i>ComponentStream</i> element for which data is returned for a <i>DataItem</i> element defined in the <i>MTConnectDevices</i> document with a category attribute of EVENT.</p> <p>If provided in the document, an <i>Events</i> XML container <b>MUST</b> contain at least one <i>Event</i> element.</p>	0..1

566

567

568    **5.5 Event Data Entities**

569    An Event XML element provides the information and data provided from a piece of equipment  
 570    for those DataItem elements defined with a category attribute of EVENT in the  
 571    MTConnectDevices document.

572    Event is an abstract type XML element and will never appear directly in the  
 573    MTConnectStreams XML document. As an abstract type XML element, Event will be  
 574    replaced in the XML document by a specific type of Event specified by the *Element Name* for  
 575    that *Data Entity*. The different types of Event elements are defined in *Section 6.2*. Examples  
 576    of XML elements representing Event include Block, Execution, and Line.

577    Event is similar to Sample, but its value can change with unpredictable frequency. Events  
 578    do not report intermediate values. As an example, when Availability transitions from  
 579    UNAVAILABLE to AVAILABLE, there is no intermediate state that can be inferred.

580    Event elements **MAY** report data values defined by a controlled vocabulary as specified in *Section 6.2*  
 581    of this document, by numeric values, or by a character string representing text or a message provided by  
 582    the piece of equipment.

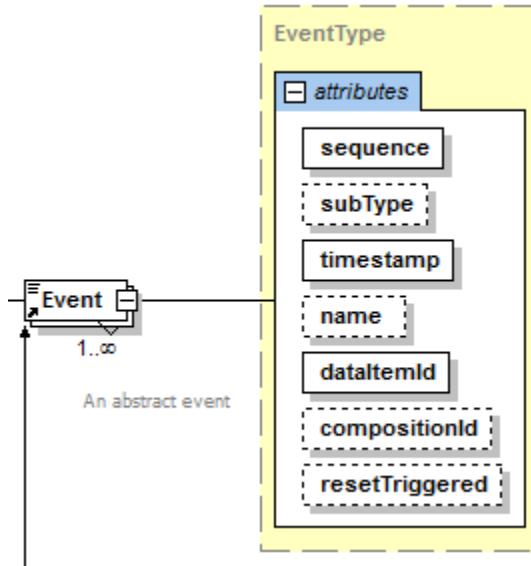

Element	Description	Occurrence
Event	<p>A XML element which provides the information and data reported from a piece of equipment for those DataItem elements defined with a category attribute of EVENT in the MTConnectDevices document.</p> <p>Event is an abstract type XML element. It is replaced in the MTConnectStreams document by a specific type of Event element.</p> <p>There <b>MAY</b> be multiple types of Event elements in an Events container.</p>	1..INF

583

584

### 585    5.5.1 XML Schema Structure for Event

586    The following XML schema represents the structure of an Event XML element showing the  
 587    attributes defined for Event elements.

588

**Figure 8: Event Schema Diagram**

### 590    5.5.2 Attributes for Event

591    The following table defines the attributes that **MAY** be used to provide additional information  
 592    for an Event XML element.

Attribute	Description	Occurrence
sequence	A number representing the sequential position of an occurrence of the Event in the data buffer of an <i>MTConnect Agent</i> .  sequence is a required attribute.  sequence <b>MUST</b> have a value represented as an unsigned 64-bit value from 1 to $2^{64}-1$ .	1
subType	The subtype of the <i>Data Entity</i> .  subType is an optional attribute.  subType <b>MUST</b> match the subType attribute of the DataItem element as defined in the MTConnectDevices document that the Event element represents.	0..1
timestamp	The most accurate time available to a piece of equipment that represents the point in time that the data reported for the Event was measured.  timestamp is a required attribute.	1

Attribute	Description	Occurrence
name	<p>The name of the Event element.</p> <p>name is an optional attribute.</p> <p>name <b>MUST</b> match the name attribute of the DataItem element as defined in the MTConnectDevices document that the Event element represents.</p> <p>An NMTOKEN XML type.</p>	0..1
dataItemId	<p>The unique identifier for the Event element.</p> <p>dataItemId is a required attribute.</p> <p>dataItemId <b>MUST</b> match the id attribute of the DataItem element as defined in the MTConnectDevices document that the Event element represents.</p>	1
resetTriggered	<p>For those DataItem elements that report data that <b>MAY</b> be periodically reset to an initial value, resetTriggered identifies when a reported value has been reset and what that has caused that reset to occur.</p> <p>resetTriggered is an optional attribute.</p> <p>resetTriggered <b>MUST</b> only be provided for the specific occurrence of a <i>Data Entity</i> reported in the MTConnectStreams document when the reset occurred and <b>MUST NOT</b> be provided for any other occurrence of the <i>Data Entity</i> reported in a MTConnectStreams document.</p>	0..1
compositionId	<p>The identifier of the Composition element defined in the MTConnectDevices document that the data reported for the Event element is associated.</p> <p>compositionId is an optional attribute.</p>	0..1

593

### 5.5.3 Response for EVENT category Data Items with a representation attribute of DISCRETE

596 EVENT category DataItem elements defined in an MTConnectDevices document with a  
 597 representation attribute of DISCRETE indicate that the value of successive occurrences of  
 598 the data reported in the associated Event type *Data Entity* in an MTConnectStreams  
 599 document **MAY** be identical. Duplicate values **MUST NOT** be suppressed by an *MTConnect*  
 600 *Agent* since each occurrence of the data item represents a different and unique Event.

601

602 An example of an EVENT category DataItem element with a representation attribute of  
 603 DISCRETE would be a parts counter that reports the completion of each part produced, versus  
 604 reporting the accumulation of parts produced over time. In this case, the associated Event  
 605 element would be represented by a *Data Entity* with an *Element Name* of  
 606 PartCountDiscrete. Each occurrence of this *Data Entity* in an MTConnectStreams  
 607 document would indicate the completion of a fixed number of parts (typically 1).

#### 608 **5.5.4 Response for EVENT category Data Items with a type attribute of** 609 **MESSAGE**

610 EVENT category DataItem elements defined in the MTConnectDevices document with a  
 611 type attribute of MESSAGE **MAY NOT** report a state change between successive occurrences  
 612 of the associated *Data Entity* being reported by a piece of equipment in the  
 613 MTConnectStreams document. If the *Data Entity* representing a message does not have a  
 614 reset state, it **SHOULD** be defined with a representation attribute of DISCRETE in the  
 615 MTConnectDevices document. In this case, each occurrence of this *Data Entity* in an  
 616 MTConnectStreams document represents a different and unique Event. The *Element Name*  
 617 for this Event element **MUST** be MessageDiscrete and each occurrence of this *Data*  
 618 *Entity* in an MTConnectStreams document would indicate a unique occurrence of the  
 619 message.

#### 620 **5.5.5 Valid Data Values for Event**

621 Event elements reported in an MTConnectStreams XML document **MUST** provide a value  
 622 in the CDATA of the *Data Entity*.

623 The value reported in the CDATA **MUST** be reported as either a *Valid Data Value* representing  
 624 the information reported from a piece of equipment or UNAVAILABLE when a *Valid Data Value*  
 625 cannot be determined.

626 The *Valid Data Value* reported for an Event represents a distinct piece of information provided  
 627 from a piece of equipment. Unlike Sample, Event does not report intermediate values that  
 628 vary over time. Event reports information that, when provided at any specific point in time,  
 629 represents the current state of the piece of equipment.

630 The representation attribute for an EVENT category data item defined in the  
 631 MTConnectDevices document specifies how an *MTConnect Agent* **MUST** record instances  
 632 of data associated with that data item and how that data **MUST** be reported as an Event  
 633 element in the MTConnectStreams document.

634 The data reported for an Event element associated with an EVENT category data item with a  
 635 representation attribute of VALUE **MUST** be either an integer, a floating-point number, a  
 636 descriptive value (text string) representing one of two or more state values defined for that data  
 637 item, or a text string representing a message.

638 If a representation attribute is not specified for a data item in an MTConnectDevices  
 639 document, the designation for the representation attribute **MUST** be interpreted as  
 640 VALUE.

641 The data reported for an Event element associated with an EVENT category data item with a  
 642 representation attribute of DISCRETE **MUST** be a numeric value representing a repetitive  
 643 occurrence of a single data value or a message. An EVENT with a representation attribute  
 644 of DISCRETE is the only case where an *MTConnect Agent* **MAY** provide successive  
 645 occurrences of a data item with identical data values since each occurrence of the Event  
 646 element represents a different and unique occurrence of the *Data Entity*.

647 The *Valid Data Value* reported as CDATA for an Event element **MUST** be formatted as part of  
 648 the content between the element tags in the XML element representing that *Data Entity*. As an  
 649 example, Event elements are formatted as follows in the XML document:

```
650 1. <PartCount dataItemId="pc4" timestamp="2009-02-26T02:02:36.48303"  

  651     name="pcount" sequence="185">238</PartCount>  

  652 3. <ControllerMode dataItemId="p3" timestamp="2009-02-26T02:02:35.716224"  

  653     name="mode" sequence="192">AUTOMATIC</ControllerMode>  

  654 5.   <Block dataItemId="cn2" name="block" sequence="206"  

  655     timestamp="2009-02-26T02:02:37.394055">G0Z1</Block>
```

656 Note: The **BOLDED** items are identified for emphasis only.

657 In these examples, 238 is the CDATA for PartCount and is a numeric value; AUTOMATIC is  
 658 the CDATA for the ControllerMode and is a descriptive value representing a state for the  
 659 *Data Entity*; and G0Z1 is a text string representing a message describing the program code  
 660 associated with the Block *Data Entity*.

## 661 **5.5.6 Unavailability of Valid Data Values for Event**

662 If an *MTConnect Agent* cannot determine a *Valid Data Value* for an Event element, the value  
 663 returned for the CDATA for the *Data Entity* **MUST** be reported as UNAVAILABLE.

664 The example below demonstrates how an *MTConnect Agent* reports the value for an Event in  
 665 the CDATA when it is unable to determine a *Valid Data Value*:

```
666 1. <Events>  

  667 2.   <ControllerMode dataItemId="p3" timestamp="2009-02-26T02:02:35.716224"  

  668     name="mode" sequence="182">UNAVAILABLE</ControllerMode>  

  669 4. </Events>
```

670 Note: The **BOLDED** items are identified for emphasis only.

## 671 **5.6 Condition Container**

672 Condition is a XML container type element. Condition organizes the *Data Entities*  
 673 returned in the MTConnectStreams XML document for those DataItem elements defined  
 674 with a category attribute of CONDITION in the MTConnectDevices document.

675 A separate Condition container will be provided for the DataItem  
 676 elements associated with each *Structural Element* of a piece of equipment defined in the  
 677 MTConnectDevices document.

678

Element	Description	Occurrence
Condition	<p>A XML container type element that organizes the data reported in the MTConnectStreams document for DataItem elements defined in the MTConnectDevices document with a <code>category</code> attribute of CONDITION.</p> <p>A separate Condition container <b>MUST</b> be provided for each ComponentStream element for which data is returned for a DataItem element defined in the MTConnectDevices document with a <code>category</code> attribute of CONDITION.</p> <p>If provided in the document, a Condition XML container <b>MUST</b> contain at least one Condition data element.</p>	0..1

679

## 680 5.7 Condition Data Entities

681 A Condition XML element provides the information and data provided from a piece of  
 682 equipment for those DataItem elements defined with a `category` attribute of CONDITION  
 683 in the MTConnectDevices document.

684 Condition provides information reported by a piece of equipment describing its health and  
 685 ability to function.

686 Condition is an abstract type XML element and will never appear directly in the  
 687 MTConnectStreams XML document. As an abstract type XML element, Condition will  
 688 be replaced in the XML document by a *Data Entity* representing the CONDITION category  
 689 DataItem element defined in the MTConnectDevices document that this Condition  
 690 element represents.

691

692 The *Data Entities* represented by Condition are structured differently than the *Data Entities*  
 693 representing Sample and Event. The *Element Name* for each Condition element reported  
 694 in the MTConnectStreams document defines the *Fault State* of the *Data Entity*. A  
 695 Condition element is identified by the *Structural Element* to which it is associated, along with  
 696 the type and dataItemId defined for the element. *Section 6.3* provides details on the  
 697 different types of Condition elements.

698

Element	Description	Occurrence
Condition	A XML element that provides the information and data reported from a piece of equipment for those DataItem elements defined with a category attribute of CONDITION in the MTConnectDevices document.  Condition is an abstract type XML element. It is replaced in the MTConnectStreams document by a specific type of Condition element.  There <b>MAY</b> be multiple types of Condition elements in a Condition container.	1..INF

699

700 CONDITION type DataItem elements defined in the MTConnectDevices document **MAY**  
 701 report multiple simultaneous *Fault States* in the MTConnectStreams document. This is  
 702 unlike a SAMPLE or EVENT DataItem element that can only report a single occurrence of a  
 703 Sample or Event element in the MTConnectStreams document at any one point in time.

704 For example, a controller on a piece of equipment may detect and report multiple format errors  
 705 in a motion program. Each error represents a separate *Fault State* from the controller. Each  
 706 *Fault State* is represented as a separate Condition element in the MTConnectStreams  
 707 document since each *Fault State* **MUST** be identified and tracked individually in the document.

### 708 **5.7.1 Element Names for Condition**

709 Condition elements are reported differently from other *Data Entity* types. The *Element Name*  
 710 reported for a Condition element represents the *Fault State* (Normal, Warning, or Fault)  
 711 associated with each Condition.

712 Examples of XML elements representing Condition elements for each of the possible *Fault  
 713 States* are:

```
714 1. <Normal type="MOTION_PROGRAM" dataItemId="cc2" sequence="25"  

  715   timestamp="2010-04-06T06:19:35.153141"></Normal>  

  716 3. <Fault type="COMMUNICATIONS" dataItemId="ccl" sequence="26"  

  717   nativeCode="IO1231" timestamp="2010-04-  

  718     06T06:19:35.153141">Communications error</Fault>  

  719 6. <Warning type="LOGIC_PROGRAM" dataItemId="pm6" sequence="32"  

  720   timestamp="2010-04-06T06:19:35.153141"><Warning/>
```

721 Note: The **BOLDED** item is identified for emphasis only.

722 **5.7.2 XML Schema Structure for Condition**

723 The following XML schema represents the structure of a Condition XML element showing  
 724 the attributes defined for Condition elements.

725

**Figure 9: Condition Schema Diagram**

727

728 **5.7.3 Attributes for Condition**

729 The following table defines the attributes used to provide additional information for a  
 730 Condition XML element.

Attribute	Description	Occurrence
sequence	A number representing the sequential position of an occurrence of the Condition in the data buffer of an <i>MTConnect Agent</i> .  sequence is a required attribute.  sequence <b>MUST</b> have a value represented as an unsigned 64-bit value from 1 to $2^{64}-1$ .	1

Attribute	Description	Occurrence
timestamp	The most accurate time available to a piece of equipment that represents the point in time that the data reported for the Condition was measured or detected.  timestamp is a required attribute.	1
name	The name of the Condition element.  name is an optional attribute.  name <b>MUST</b> match the name attribute of the DataItem element as defined in the MTConnectDevices document that this Condition element represents.  An NMOKEN XML type.	0..1
dataItemId	The unique identifier for the Condition element.  dataItemId is a required attribute.  dataItemId <b>MUST</b> match the id attribute of the DataItem element defined in the MTConnectDevices document that this Condition element represents.	1
type	An identifier of the type of fault represented by the Condition element.  type is a required attribute.  type <b>MUST</b> match the type attribute of the DataItem element defined in the MTConnectDevices document that this Condition element represents.	1
nativeCode	The native code (usually an alpha-numeric value) generated by the controller of a piece of equipment providing a reference identifier for a Condition.  nativeCode is an optional attribute.  This is the same information an operator or maintenance personnel may see as a reference code designating a specific fault code provided by the piece of equipment.	0..1
nativeSeverity	If the piece of equipment designates a severity level to a fault, nativeSeverity reports that severity information to a client software application.  nativeSeverity is an optional attribute.	0..1

Attribute	Description	Occurrence
qualifier	<p>qualifier provides additional information regarding a <i>Fault State</i> associated with the measured value of a process variable.</p> <p>qualifier is an optional attribute.</p> <p>qualifier defines whether the <i>Fault State</i> represented by the Condition indicates a measured value that is above or below an expected value of a process variable.</p> <p>If the <i>Fault State</i> represents a measured value that is greater than the expected value for the process variable, qualifier <b>MUST</b> report a value of HIGH.</p> <p>If the <i>Fault State</i> represents a measured value that is less than the expected value for the process variable, qualifier <b>MUST</b> report a value of LOW.</p>	0..1
statistic	<p>statistic provides additional information describing the meaning of the Condition element.</p> <p>statistic is an optional attribute.</p> <p>statistic <b>MUST</b> match the statistic attribute of the DataItem element defined in the MTConnectDevices document that this Condition element represents.</p>	0..1
subType	<p>subType provides additional information describing the meaning of the Condition element.</p> <p>subType is an optional attribute.</p> <p>subType <b>MUST</b> match the subType attribute of the DataItem element defined in the MTConnectDevices document that this Condition element represents.</p>	0..1
compositionId	<p>The identifier of the Composition element defined in the MTConnectDevices document that the data reported for this Condition element represents.</p> <p>compositionId is an optional attribute.</p>	0..1
xs:lang	<p>An optional attribute that specifies the language of the CDATA returned for the Condition.</p> <p>Refer to IETF RFC 4646 (<a href="http://www.ietf.org/rfc/rfc4646.txt">http://www.ietf.org/rfc/rfc4646.txt</a>) or successor for a full definition of the values for this attribute.</p> <p>xs:lang does not appear in the schema diagram.</p>	0..1

731

732

733   **5.7.3.1 `qualifier` Attribute for Condition**

734   Many Condition elements report the *Fault State* associated with the measured value of a  
735   process variable.

736   `qualifier` provides an indication whether the measured value is above or below an expected  
737   value of a process variable

738   As an example, a Condition element with a `type` attribute of AMPERAGE may differentiate  
739   between a higher than expected amperage and a lower than expected amperage by using the  
740   `qualifier` attribute.

741   When a `qualifier` of either HIGH or LOW is used with Fault and Warning, the *Fault States*  
742   can be differentiated as follows:

743       Fault, LOW  
744       Warning, LOW  
745       Normal  
746       Warning, HIGH  
747       Fault, HIGH

748   The following is an example of an XML element representing Condition using  
749   `qualifier`:

750   1. <Warning type="FILL\_LEVEL" dataItemId="pm6" qualifier="**HIGH**"  
751   2.     sequence="32" timestamp="2009-11-13T08:32:18">...</Warning>

752   Note: The `qualifier` attribute of "high" is **BOLDED** for emphasis only.

753   **5.7.4 Valid Data Values for Condition**

754   Condition elements reported in an MTConnectStreams XML document **MAY** provide a  
755   value in the CDATA of the *Data Entity* when additional information regarding the *Fault State* is  
756   available.

757   A *Valid Data Value* for the CDATA included in a Condition element **MAY** be any text  
758   string. A *Valid Data Value* is not required to be reported for a Condition category *Data*  
759   *Entity*. The *Fault State* and the attributes provided in a Condition element **MAY** be sufficient  
760   to fully describe the *Data Entity*.

761

762 The *Valid Data Value* reported as CDATA for a Condition element **MUST** be formatted as  
 763 part of the content between the element tags in the XML element representing that *Data Entity*.  
 764 As an example, Condition elements are formatted as follows in the XML document:

```
765 1. <Warning type="FILL_LEVEL" dataItemId="pm6" qualifier="HIGH"  

  766   sequence="32" timestamp="2009-11-13T08:32:18">Fill Level on Tank  

  767   #12 is reaching a high level</Warning>
```

768 Note: The **BOLDED** items are identified for emphasis only.

769 In this example, the “Fill Level on Tank #12 is reaching a high level” is the CDATA for the *Data*  
 770 *Entity*.

## 771 **5.8 Unavailability of Fault State for Condition**

772 When an *MTConnect Agent* cannot determine a valid *Fault State* for a Condition element, it  
 773 **MUST** report the *Element Name* for the *Data Entity* as Unavailable.

774 The example below demonstrates how an *MTConnect Agent* reports a Condition category  
 775 *Data Entity* when it is unable to determine a valid *Fault State*:

```
776 1. <Unavailable type="MOTION_PROGRAM" dataItemId="cc2" sequence="25"  

  777   timestamp="2009-11-13T08:32:18">...</Unavailable>  

  778 2. <Unavailable type="COMMUNICATIONS" dataItemId="cc1" sequence="26"  

  779   timestamp="2009-11-13T08:32:18">...</Unavailable>  

  780 3. <Unavailable type="LOGIC_PROGRAM" dataItemId="cc3" sequence="28"  

  781   timestamp="2009-11-13T08:32:18">...</Unavailable>  

  782 4. <Unavailable type="LOGIC_PROGRAM" dataItemId="pm6" sequence="32"  

  783   timestamp="2009-11-13T08:32:18">...</Unavailable>
```

784 Note: The **BOLDED** items are identified for emphasis only.

785

## 786 6 Listing of *Data Entities*

787 *Data Entities* that report data in MTConnectStreams documents are represented by Sample,  
 788 Event, or Condition elements based upon the category and type attributes defined for  
 789 the corresponding DataItem XML element in the MTConnectDevices document.

790 Each *Data Entity* in the MTConnectStreams document has an *Element Name*, as defined in  
 791 the following sections, based upon the corresponding category attribute defined for that  
 792 DataItem element in the MTConnectDevices document.

### 793 6.1 Sample Element Names

794 The following is a list of the XML elements that can be placed in the Samples container of the  
 795 ComponentStream element.

796 The table shows both the type attribute for each SAMPLE category DataItem element as  
 797 defined in the MTConnectDevices document and the corresponding *Element Name* for the  
 798 *Data Entity* that **MUST** be reported as a Sample element in the MTConnectStreams  
 799 document.

SAMPLE Data Item Type	Sample Element Name	Description
ACCELERATION	Acceleration	The measurement of the rate of change of velocity. Acceleration <b>MUST</b> be reported in units of MILLIMETER/SECOND <sup>2</sup> .
ACCUMULATED_TIME	AccumulatedTime	The measurement of accumulated time for an activity or event. AccumulatedTime <b>MUST</b> be reported in units of SECOND. <b>DEPRECATION WARNING:</b> May be deprecated in the future. Recommend using ProcessTimer and MachineTimer.
ANGULAR_ACCELERATION	AngularAcceleration	The measurement of the rate of change of angular velocity. AngularAcceleration <b>MUST</b> be reported in units of DEGREE/SECOND <sup>2</sup> .
ANGULAR_VELOCITY	AngularVelocity	The measurement of the rate of change of angular position. AngularVelocity <b>MUST</b> be reported in units of DEGREE/SECOND.

<b>SAMPLE</b> <b>Data Item Type</b>	<b>Sample</b> <b>Element Name</b>	<b>Description</b>
AMPERAGE	Amperage	<p>The measurement of electrical current.</p> <p>Subtypes of Amperage are ALTERNATING, DIRECT, ACTUAL, and TARGET.</p> <p>If a subType is not specified, the reported value for the data <b>MUST</b> default to the subtype of ACTUAL.</p> <p>Amperage <b>MUST</b> be reported in units of AMPERE.</p>
ANGLE	Angle	<p>The measurement of angular position.</p> <p>Subtypes of Angle are ACTUAL and COMMANDED.</p> <p>If a subType is not specified, the reported value for the data <b>MUST</b> default to the subtype of ACTUAL.</p> <p>Angle <b>MUST</b> be reported in units of DEGREE.</p>
AXIS_FEEDRATE	AxisFeedrate	<p>The measurement of the feedrate of a linear axis.</p> <p>Subtypes of AxisFeedrate are ACTUAL, COMMANDED, JOG, PROGRAMMED, and RAPID.</p> <p>If a subType is not specified, the reported value for the data <b>MUST</b> default to the subtype of PROGRAMMED.</p> <p>AxisFeedrate <b>MUST</b> be reported in units of MILLIMETER/SECOND.</p>
CLOCK_TIME	ClockTime	<p>The value provided by a timing device at a specific point in time.</p> <p>ClockTime <b>MUST</b> be reported in W3C ISO 8601 format of YYYY-MM-DDThh:mm:ss.ffff.</p>
CONCENTRATION	Concentration	<p>The measurement of the percentage of one component within a mixture of components.</p> <p>Concentration <b>MUST</b> be reported in units of PERCENT.</p>
CONDUCTIVITY	Conductivity	<p>The measurement of the ability of a material to conduct electricity.</p> <p>Conductivity <b>MUST</b> be reported in units of SIEMENS/METER.</p>

<b>SAMPLE</b> <b>Data Item Type</b>	<b>Sample</b> <i>Element Name</i>	<b>Description</b>
DISPLACEMENT	Displacement	The measurement of the change in position of an object. Displacement <b>MUST</b> be reported in units of MILLIMETER.
ELECTRICAL_ENERGY	ElectricalEnergy	The measurement of electrical energy consumption by a component. ElectricalEnergy <b>MUST</b> be reported in units of WATT_SECOND.
EQUIPMENT_TIMER	EquipmentTimer	The measurement of the amount of time a piece of equipment or a sub-part of a piece of equipment has performed specific activities. Subtypes of EquipmentTimer are LOADED, WORKING, OPERATING, POWERED, and DELAY. A subType <b>MUST</b> always be specified. EquipmentTimer <b>MUST</b> be reported in units of SECOND.
FILL_LEVEL	FillLevel	The measurement of the amount of a substance remaining compared to the planned maximum amount of that substance. FillLevel <b>MUST</b> be reported in units of PERCENT.
FLOW	Flow	The measurement of the rate of flow of a fluid. Flow <b>MUST</b> be reported in units of LITER/SECOND.
FREQUENCY	Frequency	The measurement of the number of occurrences of a repeating event per unit time. Frequency <b>MUST</b> be reported in units of HERTZ.
GLOBAL_POSITION	GlobalPosition	<b>DEPRECATED</b> in Version 1.1.0.
LEVEL	Level	<b>DEPRECATED</b> in Version 1.2.0. See FILL_LEVEL

<b>SAMPLE</b> <b>Data Item Type</b>	<b>Sample</b> <b>Element Name</b>	<b>Description</b>
LENGTH	Length	<p>The measurement of the length of an object.</p> <p>Subtypes of Length are STANDARD, REMAINING, and USEABLE.</p> <p>If a subType is not specified, the reported value for the data <b>MUST</b> default to the subtype of REMAINING.</p> <p>Length <b>MUST</b> be reported in units of MILLIMETER.</p>
LINEAR_FORCE	LinearForce	<p>The measurement of the push or pull introduced by an actuator or exerted on an object.</p> <p>LinearForce <b>MUST</b> be reported in units of NEWTON.</p>
LOAD	Load	<p>The measurement of the actual versus the standard rating of a piece of equipment.</p> <p>Load <b>MUST</b> be reported in units of PERCENT.</p>
MASS	Mass	<p>The measurement of the mass of an object(s) or an amount of material.</p> <p>Mass <b>MUST</b> be reported in units of KILOGRAM.</p>
PATH_FEEDRATE	PathFeedrate	<p>The measurement of the feedrate for the axes, or a single axis, associated with a Path component– a vector.</p> <p>Subtypes of PathFeedrate are ACTUAL, COMMANDED, JOG, PROGRAMMED, and RAPID.</p> <p>If a subType is not specified, the reported value for the data <b>MUST</b> default to the subtype of PROGRAMMED.</p> <p>PathFeedrate <b>MUST</b> be reported in units of MILLIMETER/SECOND.</p>

<b>SAMPLE</b> <b>Data Item Type</b>	<b>Sample</b> <i>Element Name</i>	<b>Description</b>
PATH_POSITION	PathPosition	<p>A measured or calculated position of a control point reported by the CONTROLLER element of a piece of equipment expressed in WORK coordinates. The coordinate system will revert to MACHINE coordinates if WORK coordinates are not available.</p> <p>Subtypes of PathPosition are ACTUAL, PROGRAMMED, COMMANDED, TARGET, and PROBE.</p> <p>If a subType is not specified, the reported value for the data <b>MUST</b> default to the subtype of ACTUAL.</p> <p>PathPosition <b>MUST</b> be reported as a set of space-delimited floating-point numbers representing a point in 3-D space. The position of the control point <b>MUST</b> be reported in units of MILLIMETER and listed in order of X, Y, and Z referenced to the coordinate system of the piece of equipment.</p> <p>An example of the value reported for PathPosition would be:</p> <pre>&lt;PathPosition ...&gt;10.123 55.232 100.981 &lt;/PathPosition&gt;</pre> <p>Where X = 10.123, Y = 55.232, and Z=100.981.</p>
PH	Ph	<p>The measurement of acidity or alkalinity.</p> <p>PH <b>MUST</b> be reported in units of PH.</p>

<b>SAMPLE</b>	<b>Sample Element Name</b>	<b>Description</b>
<b>Data Item Type</b>		
POSITION	Position	<p>A measured or calculated position of a component element as reported by a piece of equipment.</p> <p>Subtypes of Position are ACTUAL, COMMANDED, PROGRAMMED, and TARGET.</p> <p>If a subType is not specified, the reported value for the data <b>MUST</b> default to the subtype of ACTUAL.</p> <p>When Position is provided representing a measured value for the physical axes of the piece of equipment, the data <b>MUST</b> be provided in MACHINE coordinates.</p> <p>When Position is provided representing a logical or calculated position, the data <b>MUST</b> be provided in WORK coordinates and is associated with a Path element of the equipment controller.</p> <p>Position <b>MUST</b> be reported in units of MILLIMETER.</p>
POWER_FACTOR	PowerFactor	<p>The measurement of the ratio of real power flowing to a load to the apparent power in that AC circuit.</p> <p>PowerFactor <b>MUST</b> be reported in units of PERCENT.</p>
PRESSURE	Pressure	<p>The measurement of the force per unit area exerted by a gas or liquid.</p> <p>Pressure <b>MUST</b> be reported in units of PASCAL.</p>
PROCESS_TIMER	ProcessTimer	<p>The measurement of the amount of time a piece of equipment has performed different types of activities associated with the process being performed at that piece of equipment.</p> <p>Subtypes of ProcessTimer are PROCESS and DELAY.</p> <p>A subType <b>MUST</b> always be specified.</p> <p>ProcessTimer <b>MUST</b> be reported in units of SECOND.</p>
RESISTANCE	Resistance	<p>The measurement of the degree to which a substance opposes the passage of an electric current.</p> <p>Resistance <b>MUST</b> be reported in units of OHM.</p>

<b>SAMPLE</b>	<b>Sample Element Name</b>	<b>Description</b>
<b>Data Item Type</b>		
ROTARY_VELOCITY	RotaryVelocity	<p>The measurement of the rotational speed of a rotary axis.</p> <p>Subtypes of RotaryVelocity are ACTUAL, COMMANDED, and PROGRAMMED.</p> <p>If a subType is not specified, the reported value for the data <b>MUST</b> default to the subtype of ACTUAL.</p> <p>RotaryVelocity <b>MUST</b> be reported in units of REVOLUTION/MINUTE.</p>
SOUND_LEVEL	SoundLevel	<p>The measurement of a sound level or sound pressure level relative to atmospheric pressure.</p> <p>Subtypes of SoundLevel are NO_SCALE, A_SCALE, B_SCALE, C_SCALE, and D_SCALE.</p> <p>If a subType is not specified, the reported value for the data <b>MUST</b> default to the subtype of NO_SCALE.</p> <p>SoundLevel <b>MUST</b> be provided in DECIBEL.</p>
SPINDLE_SPEED	spindleSpeed	<p><b>DEPRECATED</b> in <i>Version 1.2.0</i>.</p> <p>Replaced by ROTARY_VELOCITY</p>
STRAIN	Strain	<p>The measurement of the amount of deformation per unit length of an object when a load is applied.</p> <p>Strain <b>MUST</b> be reported in units of PERCENT.</p>
TEMPERATURE	Temperature	<p>The measurement of temperature.</p> <p>Temperature <b>MUST</b> be reported in units of degrees CELSIUS.</p>
TENSION	Tension	<p>The measurement of a force that stretches or elongates an object.</p> <p>Tension <b>MUST</b> be reported in units of NEWTON.</p>
TIILT	Tilt	<p>A measurement of angular displacement.</p> <p>Tilt <b>MUST</b> be reported in units of MICRO_RADIAN.</p>
TORQUE	Torque	<p>The measurement of the turning force exerted on an object or by an object.</p> <p>Torque <b>MUST</b> be reported in units of NEWTON_METER.</p>

<b>SAMPLE</b>	<b>Sample Element Name</b>	<b>Description</b>
<b>Data Item Type</b>		
VOLT_AMPERE	VoltAmpere	<p>The measurement of the apparent power in an electrical circuit, equal to the product of root-mean-square (RMS) voltage and RMS current (commonly referred to as VA).</p> <p>VoltAmpere <b>MUST</b> be reported in units of VOLT_AMPERE.</p>
VOLT_AMPERE_REACTIVE	VoltAmpereReactive	<p>The measurement of reactive power in an AC electrical circuit (commonly referred to as VAR).</p> <p>VoltAmpereReactive <b>MUST</b> be reported in units of VOLT_AMPERE_REACTIVE.</p>
VELOCITY	Velocity	<p>The measurement of the rate of change of position of a component.</p> <p>When provided as the Velocity of the Axes component, it represents the value of the velocity vector for all given axes, similar to PathFeedrate.</p> <p>When provided as the Velocity of an individual axis component, it represents the value of the velocity for that specific axis with no influence of the relative velocity of any other axes.</p> <p>Velocity <b>MUST</b> be reported in units of MILLIMETER/SECOND.</p>
VISCOSITY	Viscosity	<p>A measurement of a fluid's resistance to flow.</p> <p>Viscosity <b>MUST</b> be reported in units of PASCAL_SECOND.</p>
VOLTAGE	Voltage	<p>The measurement of electrical potential between two points.</p> <p>Subtypes of Voltage are ALTERNATING, DIRECT, ACTUAL, and TARGET.</p> <p>If a subType is not specified, the reported value for the data <b>MUST</b> default to the subtype of ACTUAL.</p> <p>Voltage <b>MUST</b> be reported in units of VOLT.</p>

SAMPLE Data Item Type	Sample Element Name	Description
WATTAGE	Wattage	<p>The measurement of power flowing through or dissipated by an electrical circuit or piece of equipment.</p> <p>Subtypes of Wattage are ACTUAL and TARGET.</p> <p>If a subType is not specified, the reported value for the data <b>MUST</b> default to the subtype of ACTUAL.</p> <p>Wattage <b>MUST</b> be reported in units of WATT.</p>

800

801 Note: The Sample response format **MUST** be extended when the representation  
 802 attribute for the data item is TIME\_SERIES. See *Section 5.3.3* of this document for  
 803 details on extending the response format.

## 804 6.2 Event Element Names

805 The following is a list of the XML elements that can be placed in the Events container of the  
 806 ComponentStream element.

807 The table shows both the type for each EVENT category DataItem element defined in the  
 808 MTConnectDevices document and the corresponding *Element Name* for the *Data Entity* that  
 809 **MUST** be reported as an Event element in the MTConnectStreams document.

810 The table also defines the *Valid Data Values* for those Event type data items where the reported  
 811 values are restricted to a *Controlled Vocabulary*.

812

EVENT Data Item Type	Event Element Name	Description and <i>Valid Data Values</i>
ACTUATOR_STATE	ActuatorState	<p>ActuatorState represents the operational state of an apparatus for moving or controlling a mechanism or system.</p> <p><i>Valid Data Values:</i></p> <ul style="list-style-type: none"> <li>- ACTIVE: The actuator is operating</li> <li>- INACTIVE: The actuator is not operating</li> </ul>

<b>EVENT</b> <b>Data Item Type</b>	<b>Event</b> <i>Element Name</i>	<b>Description and</b> <i>Valid Data Values</i>
ALARM	Alarm	<p><b>DEPRECATED:</b> Replaced with CONDITION category data items in <i>Version 1.1.0</i>.</p>
ACTIVE_AXES	ActiveAxes	<p>The set of axes currently associated with a Path or Controller <i>Structural Element</i>.</p> <p>The <i>Valid Data Value</i> reported <b>SHOULD</b> be a space-delimited set of axes names. The names returned <b>SHOULD</b> match the name attribute of the Linear or Rotary <i>Structural Elements</i> defined in the MTConnectDevices document that this Event element represents. If name is not available, nativeName <b>MUST</b> be returned to identify the Linear or Rotary <i>Structural Elements</i>.</p> <p>For example:</p> <pre>&lt;ActiveAxes ...&gt;X Y Z W S&lt;/ActiveAxes&gt;</pre> <p>where X, Y, Z, W, and S are the nativeName attributes of the <i>Structural Elements</i>.</p> <p>If it is not specified elsewhere in the MTConnectDevices document, it <b>MUST</b> be assumed that all of the axes are associated with the Path component.</p>
AVAILABILITY	Availability	<p>Represents an <i>MTConnect Agent</i>'s ability to communicate with the data source.</p> <p>Availability <b>MUST</b> be provided for each Device <i>Structural Element</i> and <b>MAY</b> be provided for any other <i>Structural Element</i>.</p> <p><i>Valid Data Values:</i></p> <ul style="list-style-type: none"> <li>- AVAILABLE: The <i>Structural Element</i> is active and capable of providing data.</li> <li>- UNAVAILABLE: The <i>Structural Element</i> is either inactive or not capable of providing data.</li> </ul>

<b>EVENT</b> <b>Data Item Type</b>	<b>Event</b> <i>Element Name</i>	<b>Description and</b> <i>Valid Data Values</i>
AXIS_COUPLING	AxisCoupling	<p>Describes the way axes are associated to each other. This is used in conjunction with COUPLED_AXES to indicate the interaction between axes.</p> <p>The coupling of the axes <b>MUST</b> be viewed from the perspective of a specified axis. Therefore, a MASTER coupling indicates that this axis is the master for the COUPLED_AXES.</p> <p>AxisCoupling <b>MUST</b> be provided for each axis element associated with a set of axes defined by the COUPLED_AXES data item element defined in the MTConnectDevices document.</p> <p><i>Valid Data Values:</i></p> <ul style="list-style-type: none"> <li>- TANDEM: The axes are physically connected to each other and operate as a single unit.</li> <li>- SYNCHRONOUS: The axes are not physically connected to each other but are operating together in lockstep.</li> <li>- MASTER: The axis is the master of the CoupledAxes</li> <li>- SLAVE: The axis is a slave to the CoupledAxes</li> </ul>

<b>EVENT Data Item Type</b>	<b>Event Element Name</b>	<b>Description and Valid Data Values</b>
AXIS_FEEDRATE_OVERRIDE	AxisFeedrateOverride	<p>The value of a signal or calculation issued to adjust the feedrate of an individual linear type axis.</p> <p>The value provided for AxisFeedrateOverride is expressed as a percentage of the designated feedrate for the axis.</p> <p>Subtypes of AxisFeedrateOverride are JOG, PROGRAMMED, and RAPID.</p> <p>If a subType is not specified, the reported value for the data <b>MUST</b> default to the subtype of PROGRAMMED.</p> <p>The <i>Valid Data Value</i> <b>MUST</b> be a floating-point number.</p>
AXIS_INTERLOCK	AxisInterlock	<p>An indicator of the state of the axis lockout function when power has been removed and the axis is allowed to move freely.</p> <p><i>Valid Data Values:</i></p> <ul style="list-style-type: none"> <li>- ACTIVE : The axis lockout function is activated, power has been removed from the axis, and the axis is allowed to move freely.</li> <li>- INACTIVE: The axis lockout function has not been activated, the axis may be powered, and the axis is capable of being controlled by another component.</li> </ul>
AXIS_STATE	AxisState	<p>An indicator of the controlled state of a LINEAR or ROTARY component representing an axis.</p> <p><i>Valid Data Values:</i></p> <ul style="list-style-type: none"> <li>- HOME: The axis is in its home position.</li> <li>- TRAVEL: The axis is in motion</li> <li>- PARKED: The axis has been moved to a fixed position and is being maintained in that position either electrically or mechanically. Action is required to release the axis from this position.</li> <li>- STOPPED: The axis is stopped</li> </ul>

<b>EVENT Data Item Type</b>	<b>Event Element Name</b>	<b>Description and Valid Data Values</b>
BLOCK	Block	<p>The line of code or command being executed by a Controller <i>Structural Element</i>.</p> <p>Block <b>MUST</b> include the entire expression for a line of program code, including all parameters</p> <p>The <i>Valid Data Value</i> <b>MUST</b> be any text string.</p>
BLOCK_COUNT	BlockCount	<p>The total count of the number of blocks of program code that have been executed since execution started.</p> <p>The <i>Valid Data Value</i> <b>MUST</b> be an integer.</p>
CHUCK_INTERLOCK	ChuckInterlock	<p>An indication of the state of an interlock function or control logic state intended to prevent the associated CHUCK component or composition element from being operated.</p> <p>A CHUCK component or composition element may be controlled by more than one type of ChuckInterlock function. When the ChuckInterlock function is provided by an operator controlled interlock that can inhibit the ability to initiate an unclamp action of an electronically controlled chuck, this ChuckInterlock function <b>SHOULD</b> be further characterized by specifying a <i>subType</i> of MANUAL_UNCLAMP.</p> <p><i>Valid Data Values:</i></p> <ul style="list-style-type: none"> <li>- ACTIVE: The chuck cannot be unclamped</li> <li>- INACTIVE: The chuck can be unclamped.</li> </ul>

<b>EVENT Data Item Type</b>	<b>Event Element Name</b>	<b>Description and Valid Data Values</b>
CHUCK_STATE	ChuckState	<p>An indication of the operating state of a mechanism that holds a part or stock material during a manufacturing process. It may also represent a mechanism that holds any other item in place within a piece of equipment.</p> <p><i>Valid Data Values:</i></p> <ul style="list-style-type: none"> <li>- OPEN: The CHUCK component or composition element is open to the point of a positive confirmation</li> <li>- CLOSED: The CHUCK component or composition element is closed to the point of a positive confirmation</li> <li>- UNLATCHED: The CHUCK component or composition element is not closed to the point of a positive confirmation and not open to the point of a positive confirmation. It is in an intermediate position.</li> </ul>
CODE	Code	<b>DEPRECATED</b> in Version 1.1.0.

<b>EVENT Data Item Type</b>	<b>Event Element Name</b>	<b>Description and Valid Data Values</b>
COMPOSITION_STATE	CompositionState	<p>An indication of the operating condition of a mechanism represented by a Composition type element.</p> <p>Subtypes of CompositionState are ACTION, LATERAL, MOTION, SWITCHED, and VERTICAL. A subType <b>MUST</b> be provided.</p> <p><i>Valid Data Values</i> for subtype ACTION are:</p> <ul style="list-style-type: none"> <li>- ACTIVE : The Composition element is operating</li> <li>- INACTIVE : The Composition element is not operating</li> </ul> <p><i>Valid Data Values</i> for subtype LATERAL are:</p> <ul style="list-style-type: none"> <li>- RIGHT : The position of the Composition element is oriented to the right to the point of a positive confirmation</li> <li>- LEFT : The position of the Composition element is oriented to the left to the point of a positive confirmation</li> <li>- TRANSITIONING : The position of the Composition element is not oriented to the right to the point of a positive confirmation and is not oriented to the left to the point of a positive confirmation. It is in an intermediate position.</li> </ul> <p><i>Valid Data Values</i> for subtype MOTION are:</p> <ul style="list-style-type: none"> <li>- OPEN : The position of the Composition element is open to the point of a positive confirmation</li> <li>- CLOSED : The position of the Composition element is closed to the point of a positive confirmation</li> <li>- UNLATCHED : The position of the Composition element is not open to the point of a positive confirmation and is not closed to the point of a positive confirmation. It is in an intermediate position.</li> </ul>

<b>EVENT</b> <b>Data Item Type</b>	<b>Event</b> <b>Element Name</b>	<b>Description and</b> <b>Valid Data Values</b>
COMPOSITION_STATE (Continued)	CompositionState (Continued)	<p><i>Valid Data Values</i> for subtype SWITCHED are:</p> <ul style="list-style-type: none"> <li>- ON : The activation state of the Composition element is in an ON condition, it is operating, or it is powered.</li> <li>- OFF : The activation state of the Composition element is in an OFF condition, it is not operating, or it is not powered.</li> </ul> <p><i>Valid Data Values</i> for subtype VERTICAL are:</p> <ul style="list-style-type: none"> <li>- UP : The position of the Composition element is oriented in an upward direction to the point of a positive confirmation</li> <li>- DOWN : The position of the Composition element is oriented in a downward direction to the point of a positive confirmation</li> <li>- TRANSITIONING : The position of the Composition element is not oriented in an upward direction to the point of a positive confirmation and is not oriented in a downward direction to the point of a positive confirmation. It is in an intermediate position.</li> </ul>

<b>EVENT Data Item Type</b>	<b>Event Element Name</b>	<b>Description and Valid Data Values</b>
CONTROLLER_MODE	ControllerMode	<p>The current operating mode of the Controller component.</p> <p><i>Valid Data Values:</i></p> <ul style="list-style-type: none"> <li>- AUTOMATIC: The controller is configured to automatically execute a program.</li> <li>- MANUAL: The controller is not executing an active program. It is capable of receiving instructions from an external source – typically an operator. The controller executes operations based on the instructions received from the external source.</li> <li>- MANUAL_DATA_INPUT: The operator can enter a series of operations for the controller to perform. The controller will execute this specific series of operations and then stop.</li> <li>- SEMI_AUTOMATIC: The controller is operating in a single cycle mode. It executes a single set of instructions from an active program and then stops until given a command to execute the next set of instructions.</li> <li>- EDIT: The controller is currently functioning as a programming device and is not capable of executing an active program.</li> </ul>
CONTROLLER_MODE_OVERRIDE	ControllerModeOverride	<p>A setting or operator selection that changes the behavior of a piece of equipment.</p> <p>Subtypes of CompositionState are DRY_RUN, SINGLE_BLOCK, MACHINE_AXIS_LOCK, OPTIONAL_STOP, and TOOL_CHANGE_STOP.</p> <p>A subType <b>MUST</b> always be specified.</p> <p><i>Valid Data Values:</i></p> <ul style="list-style-type: none"> <li>- ON: The indicator of the ControllerModeOverride is in the ON state and the mode override is active.</li> <li>- OFF: The indicator of the ControllerModeOverride is in the OFF state and the mode override is inactive</li> </ul>

<b>EVENT Data Item Type</b>	<b>Event Element Name</b>	<b>Description and Valid Data Values</b>
COUPLED_AXES	CoupledAxes	<p>Refers to a set of associated axes.</p> <p>Used in conjunction with AxisCoupling to describe how the CoupledAxes relate to each other.</p> <p>The <i>Valid Data Value</i> reported <b>SHOULD</b> be a space-delimited set of axes names. The names returned <b>SHOULD</b> match the name attribute of the Linear or Rotary <i>Structural Elements</i> defined in the MTConnectDevices document that this Event element represents. If name is not available, nativeName <b>MUST</b> be returned to identify the Linear or Rotary <i>Structural Elements</i>.</p> <p>Example:</p> <pre>&lt;CoupledAxes ...&gt;Y1 Y2&lt;/CoupledAxes&gt;</pre>
DIRECTION	Direction	<p>The direction of motion.</p> <p>Subtypes of Direction are ROTARY and LINEAR.</p> <p>A subType <b>MUST</b> always be specified.</p> <p><i>Valid Data Values</i> for subtype ROTARY are:</p> <ul style="list-style-type: none"> <li>- CLOCKWISE: A ROTARY type component is rotating in a clockwise fashion using the right-hand rule.</li> <li>- COUNTER_CLOCKWISE: A ROTARY type component is rotating in a counter clockwise fashion using the right-hand rule.</li> </ul> <p><i>Valid Data Values</i> for subtype LINEAR are:</p> <ul style="list-style-type: none"> <li>- POSITIVE: A LINEAR type component is moving in the direction of increasing position value</li> <li>- NEGATIVE: A LINEAR type component is moving in the direction of decreasing position value</li> </ul>

<b>EVENT Data Item Type</b>	<b>Event Element Name</b>	<b>Description and Valid Data Values</b>
DOOR_STATE	DoorState	<p>The operational state of a DOOR type component or composition element.</p> <p><i>Valid Data Values:</i></p> <ul style="list-style-type: none"> <li>- OPEN: The Door is open to the point of a positive confirmation</li> <li>- CLOSED: The Door is closed to the point of a positive confirmation</li> <li>- UNLATCHED: The DOOR is not closed to the point of a positive confirmation and is not open to the point of a positive confirmation. It is in an intermediate position.</li> </ul>
END_OF_BAR	EndOfBar	<p>An indication of whether the end of a piece of bar stock being fed by a bar feeder has been reached.</p> <p>Subtypes of EndOfBar are PRIMARY and AUXILIARY.</p> <p>If a subType is not specified, the reported value for the data <b>MUST</b> default to the subtype of PRIMARY.</p> <p><i>Valid Data Values:</i></p> <ul style="list-style-type: none"> <li>- YES: The EndOfBar has been reached.</li> <li>- NO: The EndOfBar has not been reached.</li> </ul>
EMERGENCY_STOP	EmergencyStop	<p>The current state of the emergency stop signal for a piece of equipment, controller path, or any other component or subsystem of a piece of equipment.</p> <p><i>Valid Data Values:</i></p> <ul style="list-style-type: none"> <li>- ARMED: The emergency stop circuit is complete and the piece of equipment, component, or composition element is allowed to operate.</li> <li>- TRIGGERED: The emergency stop circuit is open and the operation of the piece of equipment, component, or composition element is inhibited.</li> </ul>

<b>EVENT Data Item Type</b>	<b>Event Element Name</b>	<b>Description and Valid Data Values</b>
EQUIPMENT_MODE	EquipmentMode	<p>An indication that a piece of equipment, or a sub-part of a piece of equipment, is performing specific types of activities.</p> <p>Subtypes of EquipmentMode are LOADED, WORKING, OPERATING, and POWERED.</p> <p>A subType <b>MUST</b> always be specified.</p> <p><i>Valid Data Values:</i></p> <ul style="list-style-type: none"> <li>- ON: The equipment is functioning in the mode designated by the subType.</li> <li>- OFF: The equipment is not functioning in the mode designated by the subType.</li> </ul>

<b>EVENT</b> <b>Data Item Type</b>	<b>Event</b> <i>Element Name</i>	<b>Description and</b> <i>Valid Data Values</i>
EXECUTION	Execution	<p>The execution status of the Controller component.</p> <p><i>Valid Data Values:</i></p> <ul style="list-style-type: none"> <li>- READY: The controller is ready to execute instructions. It is currently idle.</li> <li>- ACTIVE: The controller is actively executing an instruction.</li> <li>- INTERRUPTED: The execution of the controller's program has been suspended due to an external signal. Action is required to resume execution.</li> <li>- FEED_HOLD: Motion of the device has been commanded to stop at its current position. The controller remains able to execute instructions but cannot complete the current set of instructions until after motion resumes. The command to stop the motion must be removed before execution can resume.</li> <li>- STOPPED: The execution of the controller's program has been stopped in an unplanned manner and execution of the program cannot be resumed without intervention by an operator or external signal.</li> <li>- OPTIONAL_STOP: The controller's program has been intentionally stopped using an M01 or similar command. The program may be stopped at the designated location based upon the state of a secondary indication provided to the controller indicating whether the program execution must be stopped at this location or program execution should continue.</li> <li>- PROGRAM_STOPPED: The execution of the controller's program has been stopped by a command from within the program. Action is required to resume execution.</li> <li>- PROGRAM_COMPLETED: The program has completed execution.</li> </ul>

<b>EVENT</b> <b>Data Item Type</b>	<b>Event</b> <i>Element Name</i>	<b>Description and</b> <i>Valid Data Values</i>
FUNCTIONAL_MODE	FunctionalMode	<p>The current intended production status or intended use of a piece of equipment or component.</p> <p>Typically, the FunctionalMode <b>SHOULD</b> be associated with the <i>Device Structural Element</i>, but it <b>MAY</b> be associated with any <i>Structural Element</i> in the XML document.</p> <p><i>Valid Data Values:</i></p> <ul style="list-style-type: none"> <li>- PRODUCTION: The <i>Device</i> element or another <i>Structural Element</i> is currently producing product, ready to produce product, or its current intended use is to be producing product.</li> <li>- SETUP: The <i>Device</i> element or another <i>Structural Element</i> is not currently producing product. It is being prepared or modified to begin production of product.</li> <li>- TEARDOWN: The <i>Device</i> element or another <i>Structural Element</i> is not currently producing product. Typically, it has completed the production of a product and is being modified or returned to a neutral state such that it may then be prepared to begin production of a different product.</li> <li>- MAINTENANCE: The <i>Device</i> element or another <i>Structural Element</i> is not currently producing product. It is currently being repaired, waiting to be repaired, or has not yet been returned to a normal production status after maintenance has been performed.</li> <li>- PROCESS_DEVELOPMENT: The <i>Device</i> element or another <i>Structural Element</i> is being used to prove-out a new process, testing of equipment or processes, or any other active use that does not result in the production of product.</li> </ul>
HARDNESS	Hardness	<p>The measurement of the hardness of a material.</p> <p>Subtypes of Hardness are ROCKWELL, VICKERS, SHORE, BRINELL, LEEB, and MOHS.</p> <p>A subType <b>MUST</b> always be specified.</p> <p>The <i>Valid Data Value</i> <b>MUST</b> be a floating-point number.</p>

<b>EVENT Data Item Type</b>	<b>Event Element Name</b>	<b>Description and Valid Data Values</b>
LINE	Line	<b>DEPRECATED</b> in Version 1.4.0.
LINE_LABEL	LineLabel	An optional identifier for a BLOCK of code in a PROGRAM.  The <i>Valid Data Value</i> <b>MUST</b> be any text string.
LINE_NUMBER	LineNumber	A reference to the position of a block of program code within a control program.  Subtypes of LineNumber are ABSOLUTE and INCREMENTAL.  A subType <b>MUST</b> always be specified.  The <i>Valid Data Value</i> <b>MUST</b> be an integer.
MATERIAL	Material	The identifier of a material used or consumed in the manufacturing process.  The <i>Valid Data Value</i> <b>MUST</b> be any text string.
MESSAGE	Message	Any text string of information to be transferred from a piece of equipment to a client software application.  The <i>Valid Data Value</i> <b>MUST</b> be any text string.
OPERATOR_ID	OperatorId	The identifier of the person currently responsible for operating the piece of equipment.  The <i>Valid Data Value</i> <b>MAY</b> be any text string.  <b>DEPRECATION WARNING:</b> May be deprecated in the future. See USER below.

<b>EVENT Data Item Type</b>	<b>Event Element Name</b>	<b>Description and Valid Data Values</b>
PALLET_ID	PalletId	<p>The identifier for a pallet.</p> <p>The <i>Valid Data Value</i> <b>MAY</b> be any text string.</p>
PART_COUNT	PartCount	<p>The current count of parts produced as represented by the Controller component.</p> <p>Subtypes of PartCount are ALL, GOOD, BAD, TARGET, and REMAINING.</p> <p>PartCount will not be accumulated by an <i>MTConnect Agent</i> and <b>MUST</b> only be supplied if the Controller provides the count.</p> <p>PartCount <b>MAY</b> have a representation of DISCRETE. In this case, each occurrence of PartCount in an MTConnectStreams document represents a unique count of parts or product produced – it is not an accumulated count of parts or product produced.</p> <p>The <i>Valid Data Value</i> <b>MUST</b> be a floating-point number, usually an integer.</p>

<b>EVENT</b> <b>Data Item Type</b>	<b>Event</b> <i>Element Name</i>	<b>Description and</b> <i>Valid Data Values</i>
PART_ID	PartId	<p>An identifier of a part in a manufacturing operation.</p> <p>The <i>Valid Data Value</i> <b>MAY</b> be any text string.</p>
PATH_FEEDRATE_OVERRIDE	PathFeedrateOverride	<p>The value of a signal or calculation issued to adjust the feedrate for the axes associated with a Path component that may represent a single axis or the coordinated movement of multiple axes.</p> <p>The value provided for PathFeedrateOverride is expressed as a percentage of the designated feedrate for the path.</p> <p>Sub-types of PathFeedrateOverride are JOG, PROGRAMMED, and RAPID.</p> <p>If a subType is not specified, the reported value for the data <b>MUST</b> default to the subtype of PROGRAMMED.</p> <p>The <i>Valid Data Value</i> <b>MUST</b> be a floating-point number.</p>

<b>EVENT Data Item Type</b>	<b>Event Element Name</b>	<b>Description and Valid Data Values</b>
PATH_MODE	PathMode	<p>Describes the operational relationship between a PATH <i>Structural Element</i> and another PATH <i>Structural Element</i> for pieces of equipment comprised of multiple logical groupings of controlled axes or other logical operations.</p> <p><i>Valid Data Values:</i></p> <ul style="list-style-type: none"> <li>- INDEPENDENT: The path is operating independently and without the influence of another path.</li> <li>- MASTER: The path provides the reference motion for a SYNCHRONOUS or MIRROR type path to follow. For non-motion type paths, the MASTER provides information or state values that influences the operation of other paths</li> <li>- SYNCHRONOUS: The axes associated with the path are following the motion of the MASTER type path.</li> <li>- MIRROR: The axes associated with the path are mirroring the motion of the MASTER path.</li> </ul> <p>When PathMode is not specified, the operational mode of the path <b>MUST</b> be interpreted as INDEPENDENT.</p>

<b>EVENT</b> <b>Data Item Type</b>	<b>Event</b> <i>Element Name</i>	<b>Description and</b> <i>Valid Data Values</i>
POWER_STATE	PowerState	<p>The indication of the status of the source of energy for a <i>Structural Element</i> to allow it to perform its intended function or the state of an enabling signal providing permission for the <i>Structural Element</i> to perform its functions.</p> <p>Subtypes of PowerState are LINE and CONTROL.</p> <p>When the subType is LINE, PowerState represents the primary source of energy for a <i>Structural Element</i>.</p> <p>When the subType is CONTROL, PowerState represents an enabling signal providing permission for the <i>Structural Element</i> to perform its function(s).</p> <p>If a subType is not specified, the reported value for the data <b>MUST</b> default to the subtype of LINE.</p> <p><i>Valid Data Values:</i></p> <ul style="list-style-type: none"> <li>- ON: The source of energy for a <i>Structural Element</i> or the enabling signal providing permission for the <i>Structural Element</i> to perform its function(s) is present and active.</li> <li>- OFF: The source of energy for a <i>Structural Element</i> or the enabling signal providing permission for the <i>Structural Element</i> to perform its function(s) is not present or is disconnected.</li> </ul> <p><b>DEPRECATION WARNING:</b> PowerState may be deprecated in the future.</p>

<b>EVENT Data Item Type</b>	<b>Event Element Name</b>	<b>Description and <i>Valid Data Values</i></b>
POWER_STATUS	PowerStatus	<b>DEPRECATED</b> in Version 1.1.0.
PROGRAM	Program	<p>The name of the logic or motion program being executed by the Controller component.</p> <p>This is usually the name of the file containing the program instructions.</p> <p>The <i>Valid Data Value</i> <b>MUST</b> be any text string.</p>

<b>EVENT</b> <b>Data Item Type</b>	<b>Event</b> <i>Element Name</i>	<b>Description and</b> <i>Valid Data Values</i>
PROGRAM_EDIT	ProgramEdit	<p>An indication of the status of the Controller component's program editing mode.</p> <p>On many controls, a program can be edited while another program is currently being executed.</p> <p>ProgramEdit provides an indication of whether the controller is being used to edit programs in either case.</p> <p><i>Valid Data Values:</i></p> <ul style="list-style-type: none"> <li>- ACTIVE: The controller is in the program edit mode.</li> <li>- READY: The controller is capable of entering the program edit mode and no function is inhibiting a change to that mode.</li> <li>- NOT_READY: A function is inhibiting the controller from entering the program edit mode.</li> </ul>
PROGRAM_EDIT_NAME	ProgramEditName	<p>The name of the program being edited.</p> <p>This is used in conjunction with PROGRAM_EDIT when it is in an ACTIVE state.</p> <p>The <i>Valid Data Value</i> <b>MUST</b> be any text string.</p>
PROGRAM_COMMENT	ProgramComment	<p>A comment or non-executable statement in the control program.</p> <p>The <i>Valid Data Value</i> <b>MUST</b> be any text string.</p>
PROGRAM_HEADER	ProgramHeader	<p>The non-executable header section of the control program.</p> <p>The content <b>SHOULD</b> be limited to 512 bytes.</p> <p>The <i>Valid Data Value</i> <b>MUST</b> be any text string.</p>

<b>EVENT Data Item Type</b>	<b>Event Element Name</b>	<b>Description and Valid Data Values</b>
ROTARY_MODE	RotaryMode	<p>The current operating mode for a Rotary type axis.</p> <p><i>Valid Data Values:</i></p> <ul style="list-style-type: none"> <li>- SPINDLE: The axis is functioning as a spindle. Generally, it is configured to rotate at a defined speed.</li> <li>- INDEX: The axis is configured to index to a set of fixed positions or to incrementally index by a fixed amount.</li> <li>- CONTOUR: The position of the axis is being interpolated as part of the PathPosition defined by the Controller Structural Element.</li> </ul>
ROTARY_VELOCITY_OVERRIDE	RotaryVelocityOverride	<p>The value of a command issued to adjust the programmed velocity for a Rotary type axis.</p> <p>This command represents a percentage change to the velocity calculated by a logic or motion program or set by a switch for a Rotary type axis.</p> <p>RotaryVelocityOverride is expressed as a percentage of the programmed RotaryVelocity.</p> <p>The <i>Valid Data Value MUST</i> be a floating-point number.</p>
SERIAL_NUMBER	SerialNumber	<p>The serial number associated with a Component, Asset, or Device.</p> <p>The <i>Valid Data Value MUST</i> be any text string.</p>
SPINDLE_INTERLOCK	SpindleInterlock	<p>An indication of the status of the spindle for a piece of equipment when power has been removed and it is free to rotate.</p> <p><i>Valid Data Values:</i></p> <ul style="list-style-type: none"> <li>- ACTIVE: Power has been removed and the spindle cannot be operated.</li> <li>- INACTIVE: Spindle has not been deactivated.</li> </ul>

<b>EVENT Data Item Type</b>	<b>Event Element Name</b>	<b>Description and Valid Data Values</b>
TOOL_ID	ToolID	<b>DEPRECATED</b> in Version 1.2.0. See Tool_ASSET_ID. <del>The identifier of the tool currently in use for a given Path</del>
TOOL_ASSET_ID	ToolAssetId	The unique identifier of an individual tool asset. The <i>Valid Data Value</i> <b>MUST</b> be any text string.
TOOL_NUMBER	ToolNumber	The identifier assigned by the Controller component to a cutting tool when in use by a piece of equipment. The <i>Valid Data Value</i> <b>MUST</b> be any text string.
TOOL_OFFSET	ToolOffset	A reference to the tool offset variables applied to the active cutting tool associated with a Path in a Controller type component. Subtypes of ToolOffset are RADIAL and LENGTH. A subType <b>MUST</b> always be specified. The <i>Valid Data Value</i> <b>MUST</b> be a floating-point number.
USER	User	The identifier of the person currently responsible for operating the piece of equipment. Subtypes of User are OPERATOR, MAINTENANCE, and SET_UP. A subType <b>MUST</b> always be specified. The <i>Valid Data Value</i> <b>MUST</b> be any text string.
WIRE	Wire	The identifier for the type of wire used as the cutting mechanism in Electrical Discharge Machining or similar processes. The <i>Valid Data Value</i> <b>MUST</b> be any text string.

<b>EVENT Data Item Type</b>	<b>Event Element Name</b>	<b>Description and Valid Data Values</b>
WORKHOLDING_ID	WorkholdingId	The identifier for the current workholding or part clamp in use by a piece of equipment. The <i>Valid Data Value</i> <b>MUST</b> be any text string.
WORK_OFFSET	WorkOffset	A reference to the offset variables for a work piece or part associated with a Path in a Controller type component. The Valid Data Value <b>MUST</b> be a floating-point number.

813

814 Note: The Event response format **MUST** be extended to represent those data items where  
 815 the representation attribute is DISCRETE. See *Section 5.5.3* of this document  
 816 for details on extending the response format.

### 6.3 Types of Condition Elements

As described above in Section 5.7, Condition *Data Entities* are reported differently from other data item types. They are reported based on the *Fault State* for each Condition. Unlike Sample and Event data items that are identified by their *Element Name*, Condition data items are defined by the *type* and *subType* (where applicable) attributes defined for each Condition.

The *type* and *subType* (where applicable) attributes for a Condition element **MAY** be any of the *type* and *subType* attributes defined for SAMPLE category or EVENT category data item listed in the *Device Information Model*.

The following table lists additional Condition *Data Entities* that have been defined to represent the health and fault status of *Structural Elements*. The table defines the *type* attribute for each of these additional Condition category elements that **MAY** be reported in the MTConnectStreams document.

830

CONDITION Data Item Type	Description
ACTUATOR	An indication of a fault associated with an actuator.
CHUCK_INTERLOCK	An indication of the operational condition of the interlock function for an electronically controller chuck.
COMMUNICATIONS	An indication that the piece of equipment has experienced a communications failure.
DATA_RANGE	An indication that the value of the data associated with a measured value or a calculation is outside of an expected range.
DIRECTION	An indication of a fault associated with the direction of motion of a <i>Structural Element</i> .
END_OF_BAR	An indication that the end of a piece of bar stock has been reached.
HARDWARE	An indication of a fault associated with the hardware subsystem of the <i>Structural Element</i> .
INTERFACE_STATE	An indication of the operational condition of an Interface component.
LOGIC_PROGRAM	An indication that an error occurred in the logic program or programmable logic controller (PLC) associated with a piece of equipment.
MOTION_PROGRAM	An indication that an error occurred in the motion program associated with a piece of equipment

CONDITION <b>Data Item Type</b>	Description
SYSTEM	A general purpose indication associated with an electronic component of a piece of equipment or a controller that represents a fault that is not associated with the operator, program, or hardware.

# MTConnect<sup>®</sup> Standard

## Part 4.0 – Assets Information Model

Version 1.4.0

Prepared for: MTConnect Institute

Prepared on: March 31, 2018

# MTConnect® Specification and Materials

AMT - The Association For Manufacturing Technology (“AMT”) owns the copyright in this MTConnect® Specification or Material. AMT grants to you a non-exclusive, non-transferable, revocable, non-sublicensable, fully-paid-up copyright license to reproduce, copy and redistribute this MTConnect® Specification or Material, provided that you may only copy or redistribute the MTConnect® Specification or Material in the form in which you received it, without modifications, and with all copyright notices and other notices and disclaimers contained in the MTConnect® Specification or Material.

If you intend to adopt or implement an MTConnect® Specification or Material in a product, whether hardware, software or firmware, which complies with an MTConnect® Specification, you **MUST** agree to the MTConnect® Specification Implementer License Agreement (“Implementer License”) or to the MTConnect® Intellectual Property Policy and Agreement (“IP Policy”). The Implementer License and IP Policy each sets forth the license terms and other terms of use for MTConnect® Implementers to adopt or implement the MTConnect® Specifications, including certain license rights covering necessary patent claims for that purpose. These materials can be found at [www.MTConnect.org](http://www.MTConnect.org), or by contacting [info@MTConnect.org](mailto:info@MTConnect.org).

MTConnect® Institute and AMT have no responsibility to identify patents, patent claims or patent applications which may relate to or be required to implement a Specification, or to determine the legal validity or scope of any such patent claims brought to their attention. Each MTConnect® Implementer is responsible for securing its own licenses or rights to any patent or other intellectual property rights that may be necessary for such use, and neither AMT nor MTConnect® Institute have any obligation to secure any such rights.

This Material and all MTConnect® Specifications and Materials are provided “as is” and MTConnect® Institute and AMT, and each of their respective members, officers, affiliates, sponsors and agents, make no representation or warranty of any kind relating to these materials or to any implementation of the MTConnect® Specifications or Materials in any product, including, without limitation, any expressed or implied warranty of noninfringement, merchantability, or fitness for particular purpose, or of the accuracy, reliability, or completeness of information contained herein. In no event shall MTConnect® Institute or AMT be liable to any user or implementer of MTConnect® Specifications or Materials for the cost of procuring substitute goods or services, lost profits, loss of use, loss of data or any incidental, consequential, indirect, special or punitive damages or other direct damages, whether under contract, tort, warranty or otherwise, arising in any way out of access, use or inability to use the MTConnect® Specification or other MTConnect® Materials, whether or not they had advance notice of the possibility of such damage.

## 1    1 Purpose of This Document

2    This document, *Part 4.0 – Assets Information Model* of the MTConnect Standard, details  
3    information that is common to all types of *MTConnect Assets*. *Part 4.0* and its sub-parts of the  
4    MTConnect Standard provide semantic models for entities that are used in the manufacturing  
5    process, but are not considered to be a piece of equipment. These entities are defined as  
6    *MTConnect Assets*. These *Assets* may be removed from a piece of equipment without detriment  
7    to the function of the equipment and can be associated with other pieces of equipment during  
8    their lifecycle. The data associated with these *Assets* may be retrieved from multiple sources that  
9    are each responsible for providing their knowledge of the *Asset*.

## 10    **2 Terminology and Conventions**

11    Please refer to *Part 1.0 - Overview and Fundamentals, Section 2* for a dictionary of terms, re-  
12    served language, and document conventions used in the MTConnect Standard.

## 13    3 MTConnect Assets

### 14    3.1 Overview

15    The MTConnect Standard supports a simple distributed storage mechanism that allows applications  
16    and equipment to share and exchange complex information models in a similar way to a  
17    distributed data store. The *Asset Information Model* associates each electronic *MTConnectAssets*  
18    document with a unique identifier and allows for some predefined mechanisms to find, create,  
19    request, updated, and delete these electronic documents in a way that provides for consistency  
20    across multiple pieces of equipment.

21    The protocol provides a limited mechanism of accessing *MTConnect Assets* using the following  
22    properties: `assetId`, *Asset* type (element name of *Asset* root), and the piece of equipment asso-  
23    ciated with the *Asset*. These access strategies will provide the following services and answer the  
24    following questions: What *Assets* are from a particular piece of equipment? What are the *Assets*  
25    of a particular type? What *Assets* is stored for a given `assetId`?

26    Although these mechanisms are provided, an *MTConnect Agent* should not be considered a data  
27    store or a system of reference. The *Agent* is providing an ephemeral storage capability that will  
28    temporarily manage the data for applications wishing to communicate and manage data as need-  
29    ed by the various processes. An application cannot rely on an *Agent* for long term persistence or  
30    durability since the *Agent* is only required to temporarily store the *Asset* data and may require  
31    another system to provide the source data upon initialization. An *MTConnect Agent* is always  
32    providing the best-known equipment centric view of the data given the limitations of that piece  
33    of equipment.

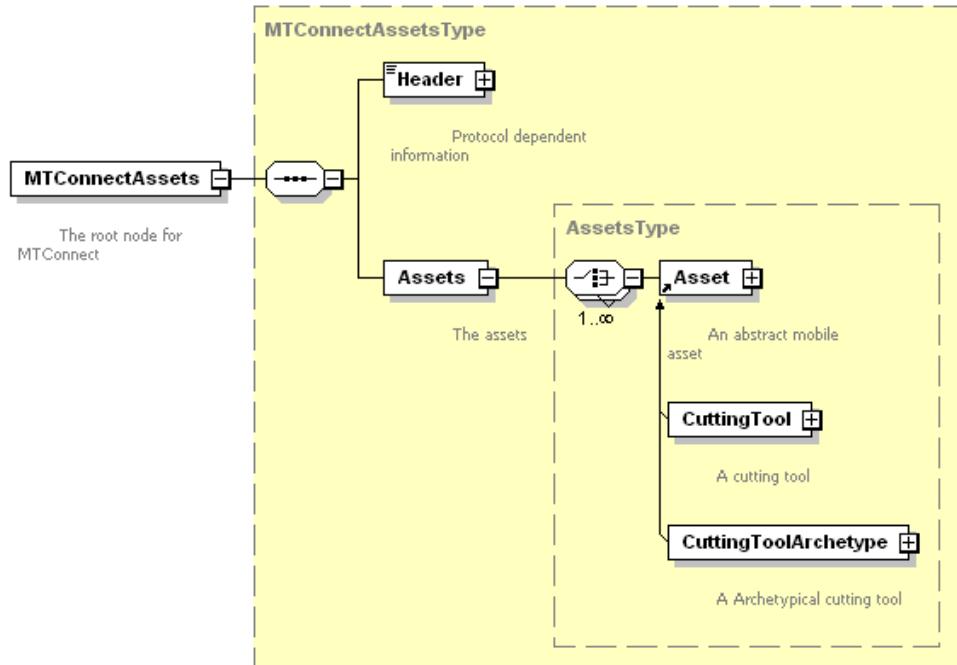

34

35    Note: Currently only cutting tools have been addressed by the MTConnect Standard and other  
36    *MTConnect Assets* will be defined in later versions of the Standard.

37

38    **3.2 MTConnectAssets**

39

40

41    **Figure 1: MTConnectAssets Schema**

42

43    At the top level of the *MTConnectAssets* document is a standard header, as stated in *Part 1.0 - Overview and Fundamentals*, and one or more *MTConnect Assets*. Each *Asset* is required to have an *assetId* that serves as a unique identifier of that *Asset*. *assetId* allows an application to request the *Asset* data from an *MTConnect Agent*.

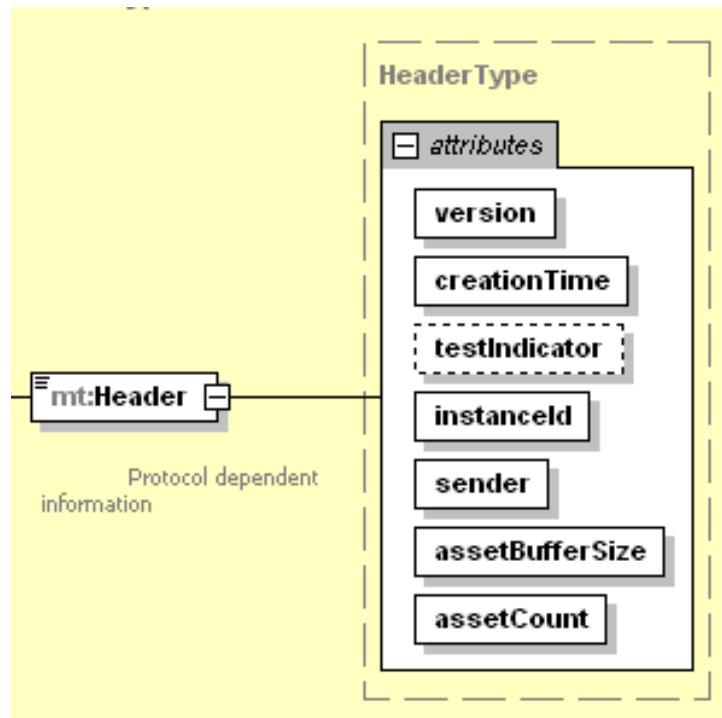

47    In the remaining *Part 4.x* sub-part documents of *MTConnect Assets*, various types of *Assets* will be introduced such as cutting tools and other *Asset* types. Currently only cutting tools have been defined in *Part 4.1 – Cutting Tools*.

50

51    **3.2.1 MTConnectAssets Header**

52    The MTConnectAssets header is where the protocol sequence information **MUST** be provided.  
 53    The following XML schema represents the structure of the MTConnectAssets header  
 54    showing the attributes defined for MTConnectAssets.

55    Refer to *Part 1.0 – Overview and Fundamentals* for more information on headers.

56

57    **Figure 2: Header Schema Diagram for MTConnectAssets**

58

59    **3.2.1.1 Header Attributes**

60    The following table defines the attributes used to provide information for an MTConnectAssets header.

62

Attribute	Description	Occurrence
version	The protocol version number. This is the <i>major</i> and <i>minor</i> version number of the MTConnect Standard being used. For example, if the version number of the Standard used is 10.21.33, the <i>version</i> will be 10.21.  version is a required attribute.	1

Attribute	Description	Occurrence
creationTime	The time the response was created.  creationTime is a required attribute.	1
testIndicator	Optional flag that indicates the system is operating in test mode. This data is only for testing and indicates that the data is simulated.  testIndicator is an optional attribute.	0..1
instanceId	A number indicating which invocation of the <i>MTConnect Agent</i> . This is used to differentiate between separate instances of the <i>Agent</i> . This value <b>MUST</b> have a maximum value of $2^{64}-1$ and <b>MUST</b> be stored in an unsigned 64-bit integer.  instanceId is a required attribute.	1
sender	The <i>MTConnect Agent</i> identification information.  sender is a required attribute.	1
assetBufferSize	The maximum number of <i>MTConnect Assets</i> that will be retained by the <i>MTConnect Agent</i> . The assetBufferSize <b>MUST</b> be an unsigned positive integer value with a maximum value of $2^{32}-1$ .  assetBufferSize is a required attribute.	1
assetCount	The total number of <i>MTConnect Assets</i> in an <i>MTConnect Agent</i> . This <b>MUST</b> be an unsigned positive integer value with a maximum value of $2^{32}-1$ . This value <b>MUST NOT</b> be greater than assetBufferSize  assetCount is a required attribute.	1

63

64 Example:

```

65 1. <Header creationTime="2010-03-13T07:59:11+00:00" sender="localhost"
66 2.     instanceId="1268463594" assetBufferSize="1024" version="1.1"
67 3.     assetCount="12" />
68
69

```

### 70    3.2.2 Assets

71    Assets is an XML container used to group information about various *MTConnect Asset* types.  
 72    Assets contains one or more Asset XML elements.

Element	Description	Occurrence
Assets	XML container that consists of one or more types of Asset XML elements.	0..1

73

### 74    3.2.3 Asset

75    An Asset XML element is a container type XML element used to organize information de-  
 76    scribing an entity that is not a piece of equipment. Asset is an abstract type XML element and  
 77    will never appear directly in the MTConnect XML document. As an abstract type XML ele-  
 78    ment, Asset will be replaced in the XML document by specific *MTConnect Asset* type.

Element	Description	Occurrence
Asset	An abstract XML element. Replaced in the XML document by types of Asset elements representing entities that are not pieces of equipment.  There can be multiple types of Asset XML elements in the document.	1..INF

79

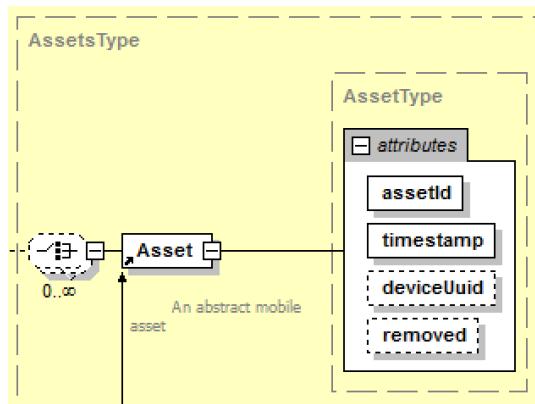

80    There are various types of entities or Asset types. Each type of Asset is described in sub-parts of  
*Part 4.0 – Assets Information Model*. These sub-parts are designated by a *Part 4.x* document  
 81    number. Currently only the *MTConnect Asset* type of cutting tools has been defined in *Part 4.1*  
 82    – *Cutting Tools*.

84    For all *MTConnect Asset* types there are some common attributes and elements that apply to all  
 85    of them. The following defines these common attributes and elements.

86

87    **3.2.3.1 Common Asset Attributes**

88    The following XML schema represents the structure of Asset showing the attributes defined  
 89    for Asset.

90

91    **Figure 3: Asset Schema**

92

93    The following table defines the attributes that are used to provide information for the Asset element.  
 94

95

Attribute	Description	Occurrence
assetId	The unique identifier for the <i>MTConnect Asset</i> . The identifier <b>MUST</b> be unique with respect to all other <i>Assets</i> in an MTConnect installation. The identifier <b>SHOULD</b> be globally unique with respect to all other <i>Assets</i> .  assetId is a required attribute.	1
timestamp	The time this <i>MTConnect Asset</i> was last modified. Always given in UTC. The timestamp <b>MUST</b> be provided in UTC (Universal Time Coordinate, also known as GMT). This is the time the <i>Asset</i> data was last modified.  timestamp is a required attribute.	1
deviceUuid	The piece of equipment's UUID that supplied this data. This is an optional element references to the <code>uuid</code> attribute given in the <code>Device</code> element. This can be any series of numbers and letters as defined by the XML type <code>NMTOKEN</code> .	0..1

Attribute	Description	Occurrence
removed	This is an optional attribute that is an indicator that the <i>MTConnect Asset</i> has been removed from the piece of equipment. If the <i>Asset</i> is marked as removed, it will not be visible to the client application unless the <code>includeRemoved=true</code> parameter is provided in the URL. If this attribute is not present it <b>MUST</b> be assumed to be false. The value is an <code>xsi:boolean</code> type and <b>MUST</b> be <code>true</code> or <code>false</code> .	0..1

96

97 All *MTConnect Assets* **MUST** have an `assetId` that differs from all the other *Assets* in a  
 98 facility and preferably globally unique, such as a RFC 4122 UUID. There **MUST** never be more  
 99 than one *Asset* provided by an *Agent* with the same `assetId` in the same shop.

100 The following attributes **MUST** be provided and are common to all *MTConnect Asset* types: the  
 101 `assetId` attribute providing the unique identifier for the *Asset*, and the `timestamp` providing  
 102 the time the *Asset* was inserted or updated. A removed flag that if `true` indicates the *Asset* has  
 103 been removed (deleted) from the equipment is optional, however the *Asset* will still be available  
 104 if requested directly or a request is made that includes removed *Assets*.

105 An *MTConnectAssets* document contains information pertaining to something that is not a  
 106 direct component of the piece of equipment and can be relocated to another piece of equipment  
 107 or location during its lifecycle. The *Asset* will contain data that will be changed as a unit,  
 108 meaning that at any given point in time the latest version of the complete state for this *Asset* will  
 109 be provided.

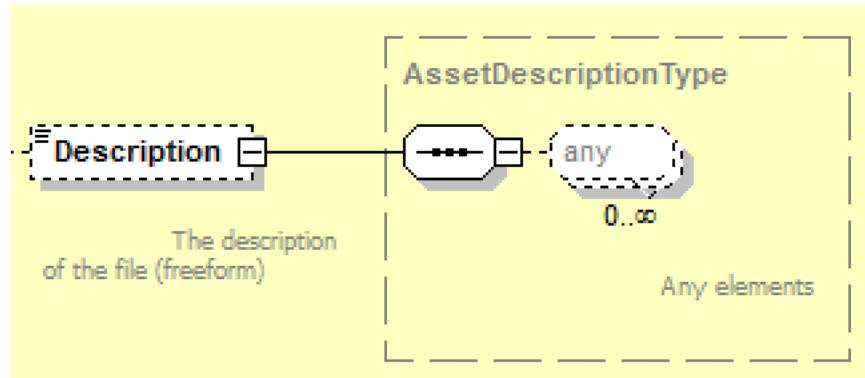

110 Each piece of equipment or location may have a different view of this *Asset* and it is the responsibility  
 111 of an application to collect and determine the aggregate information and keep a historical  
 112 record if required. An *MTConnect Agent* will allow any application or other equipment to re-  
 113 quest this information. The piece of equipment **MUST** supply the latest and most accurate in-  
 114 formation regarding a given *Asset*.

115

116    **3.2.3.2 Common Asset Elements**

117    The element **Description** is the only element common to all *Asset* types.

118    The following XML schema represents the structure of **Description**.

119

**Figure 4: Description Schema**

121

122    The following table defines the elements that are used to provide information for Asset.

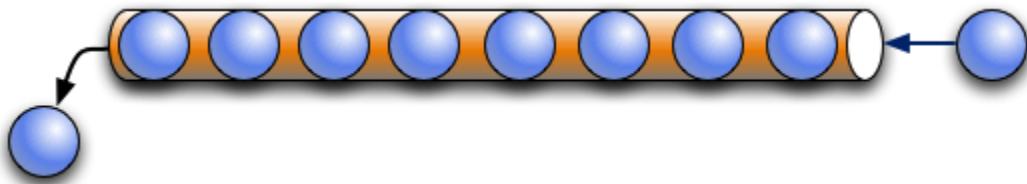

Element	Description	Occurrence
Description	An optional element that can contain any descriptive content. This can contain configuration information and manufacturer specific details. This element is defined to contain mixed content and XML elements can be added to extend the descriptive semantics of MTConnect Standard.	0..1

123

## 124 4 MTConnect Assets Architecture

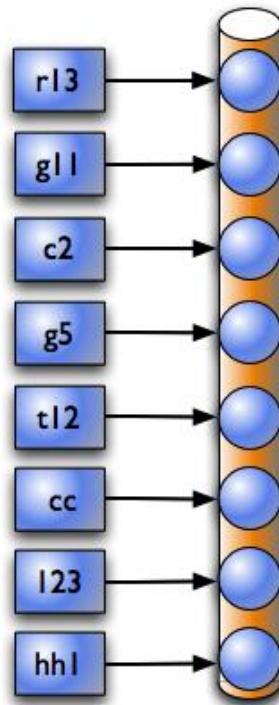

### 125 4.1 MTConnect Agent Asset Storage

126 The *MTConnect Agent* stores *MTConnect Assets* in a similar fashion as the *Agent* data storage  
 127 described in *Part 1.0 – Overview and Fundamentals*. The storage of information is contained in  
 128 the *asset buffer*. The *MTConnect Agent* provides a limited number of *Assets* that can be stored at  
 129 one time and uses the same method of pushing out the oldest *Asset* when the *asset buffer* is full.  
 130 The *asset buffer* size for the *Asset* storage is maintained separately from the *Sample*, *Event*,  
 131 and *Condition* storage.

132

133 *MTConnect Assets* also behave like a key/value in memory database. In the case of the *Asset*, the  
 134 key is the `assetId` and the value is the XML document describing the *Asset*. The key can be  
 135 any string of letters, punctuation or digits and represent the domain specific coding scheme for  
 136 their assets. Each *Asset* type will have a recommended way to construct a unique `assetId`, for  
 137 example, a cutting tool **SHOULD** be identified by the tool ID and serial number as a composed  
 138 synthetic identifier.

139

140 As in this example above, each of the *Assets* is referred to by their key. The key is independent  
 141 of the order in the *asset buffer* storage.

142 **4.2 Asset Protocol**

143 MTConnect Standard provides methods to retrieve an *MTConnect Asset* or a set of *Assets* given  
 144 various criteria. These criteria are as follows: The `assetId`, the *Asset* type as defined by the  
 145 name of the *Asset*'s topmost element, and the originating piece of equipment.

146 The URL format is similar to the Probe and Sample structure. For example, to request an  
 147 *MTConnect Asset* by `assetId`, reference each `assetId` directly as follows:

148 **4.2.1 Asset by `assetId`**

149   1. url: `http://example.com/asset/e39d23ba-ef2d-11e6-b12c-`  
 150   2. `28cf91a82ef`

151

152 Returns the `MTConnectAssets` document for *Asset* `e39d23ba-ef2d-11e6-b12c-28cf91a82ef`

153 Request multiple *Assets* by each `assetId`:

154   1. url: `http://example.com/asset/e39d23ba-ef2d-11e6-b12c-`  
 155   2. `;8cf91a82ef;e46d5256-ef2d-11e6-96aa-28cf91a82ef`

156

157 Returns the `MTConnectAssets` document for *Assets* `e39d23ba-ef2d-11e6-b12c-28cf91a82ef`  
 158 and `e46d5256-ef2d-11e6-96aa-28cf91a82ef`.

159 Request for all the *Assets* in the *MTConnect Agent*:

160   1. url: `http://example.com/assets`

161

162 Returns all available *MTConnect Assets* in the *MTConnect Agent*. The *Agent* **MAY** return a limited set if there are too many *Asset* records. The *Assets* **MUST** be added to the beginning with the most recently modified *Asset*.

165 **4.2.2 Asset for a Given Type**

166   1. url: `http://example.com/assets?type="CuttingTool"`

167

168 Returns all available *CuttingTool Assets* from the *MTConnect Agent* of the type `CuttingTool`. The *Agent* **MAY** return a limited set if there are too many *Asset* records. The *Assets* **MUST** be added to the beginning with the most recently modified assets.

171 Request for all *Assets* of a given type in the *MTConnect Agent* up to a maximum count:

172   1. url: `http://example.com/assets?type=CuttingTool&count=1000`

173

174 Returns all available *CuttingTool Assets* from the *MTConnect Agent*. The *Agent* **MUST** return up to 1000 *Assets* beginning with the most recently modified *Assets* if they exist.

176

177    **4.2.3 Assets Including Removed Assets**

178    1. url: `http://example.com/assets?type=CuttingTool&removed=true`  
179

180    Returns all available *CuttingTool Assets* from the *MTConnect Agent*. With the removed  
181    flag, *Assets* that have been removed but are included in the result set.

182    **4.2.4 Assets for a Piece of Equipment**

183    If no `assetId` is provided with a general *Assets* request, it would be as follows:

184    1. url: `http://example.com/Mill123/assets`  
185

186    All *MTConnect Assets* will be provided for that piece of equipment (`Device`) up to the *MTConnect*  
187    *Agent's* maximum count or as specified with the `count` parameter. These *Assets* will be  
188    returned starting from the newest to oldest list.

189    Any of the previous constraints can also be applied to the request, for example, to get all the *Cut-*  
190    *tingTool* instances for a given piece of equipment:

191    1. url: `http://example.com/Mill123/asset/?type=CuttingTool&count=100`  
192

193    The previous request will get the newest 100 *Cutting Tool Instance Assets* from the *MTConnect*  
194    *Agent* for Mill123. Similarly:

195    1. url: `http://example.com/Mill123/asset/?type=CuttingToolArchetype`  
196

197    Will provide all *Cutting Tool Archetype Assets* with the `deviceUuid` of Mill123.

198

## 199 5 Extensions to Part 2.0 – Devices Information Model

200 This document will add the following data item types to support change notification when an  
 201 *MTConnect Asset* is added or updated. The data item **MUST** be placed in the DataItems con-  
 202 tainer associated with Device. The Device **MUST** be the piece of equipment that is supply-  
 203 ing the asset data.

204 **5.1 Data Item Types added for EVENT Category**

Data Item type/subtype	Description
ASSET_CHANGED	The value of the <b>CDATA</b> for the event <b>MUST</b> be the <code>assetId</code> of the asset that has been added or changed. There will not be a separate message for new assets.
ASSET_REMOVED	The value of the <b>CDATA</b> for the event <b>MUST</b> be the <code>assetId</code> of the asset that has been removed. The asset will still be visible if requested with the <code>includeRemoved</code> parameter as described in the protocol section. When assets are removed they are not moved to the beginning of the most recently modified list.

205

206 **5.1.1 ASSET\_CHANGED Data Item Type**

207 When an *MTConnect Asset* is added or modified, an AssetChanged event **MUST** be pub-  
 208 lished to inform an application that new asset data is available. The application can request the  
 209 new asset data from the piece of equipment at that time. Every time the asset data is modified an  
 210 AssetChanged event will be published. Since the asset data is a complete electronic docu-  
 211 ment, the system will publish a single AssetChanged event for the entire set of changes.

212 The asset data **MUST** remain constant until the AssetChanged event is published. Once it is  
 213 published the data **MUST** change to reflect the new content at that instant. The timestamp of the  
 214 asset will reflect the time the last change was made to the asset data.

215 **5.1.2 ASSET\_REMOVED Data Item Type**

216 When an *MTConnect Asset* has been removed from an *MTConnect Agent*, or marked as removed,  
 217 an AssetRemoved event **MUST** be generated in a similar way to the AssetChanged event.  
 218 The CDATA of the AssetRemoved event **MUST** contain the `assetId` that was just re-  
 219 moved.

220 Every time an *MTConnect Asset* is modified or added it will be moved to the beginning of the  
 221 *asset buffer* and become the newest Asset. As the *asset buffer* fills up, the oldest Asset will be  
 222 pushed out and its information will be removed. The MTConnect Standard does not specify the  
 223 maximum size of the *asset buffer*, and if the implementation desires, permanent storage **MAY** be  
 224 used to store the Assets. A value of  $4,294,967,296$  or  $2^{32}$  can be given to indicate unlimited  
 225 storage.

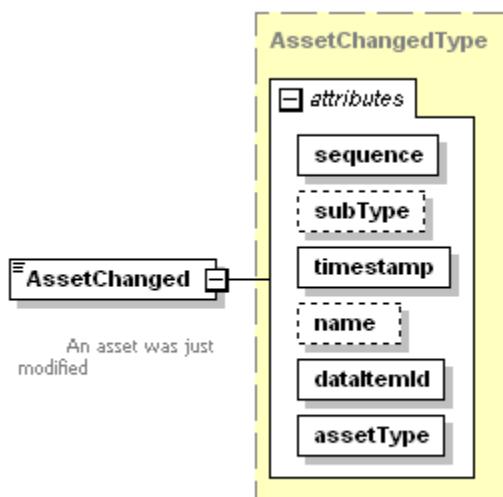

226 There is no requirement for persistent *Asset* storage. If the *MTConnect Agent* fails, all existing  
227 *MTConnect Assets* **MAY** be lost. It is the responsibility of the implementation to restore the lost  
228 *Asset* data and it is the responsibility of the application to persist the *Asset* data. The *MTConnect*  
229 *Agent* **MAY** make no guarantees about availability of *Asset* data after the *Agent* stops.

## 230 6 Extensions to Part 3.0 – Streams Information Model

231 The associated modifications **MUST** be added to *Part 3.0 – Streams Information Model* to add  
 232 the following event to the Events in the streams.

### 233 6.1 AssetChanged Extension to Events

234 The AssetChanged element extends the base Event type XML data element defined in *Part*  
 235 *3.0 – Streams Information Model* and adds the assetType attribute to the base Event. This  
 236 new Event will signal whenever a new *MTConnect Asset* is added or the existing definition of  
 237 an *Asset* is updated. The assetId is provided as the CDATA value and can be used to request  
 238 the *Asset* data from the *MTConnect Agent*.

239

240 **Figure 5: AssetChanged Schema**

241

242 **AssetChanged** An *MTConnect Asset* has been added or modified. The **CDATA** for the  
 243 AssetChanged element **MUST** be the `assetId` of the *Asset* that has been  
 244 modified.

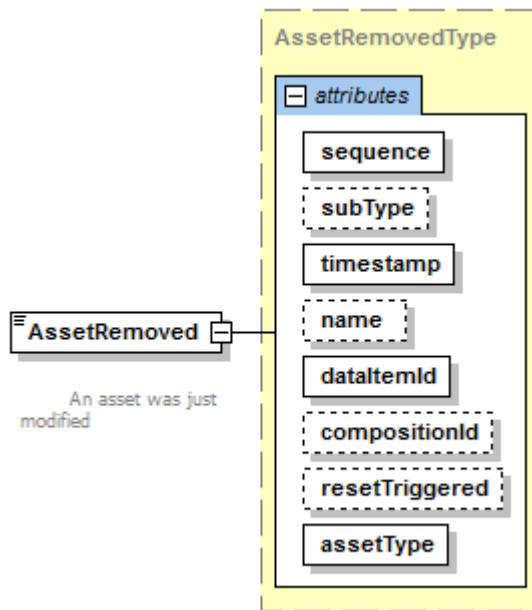

#### 245 6.1.1 AssetChanged Attributes:

Attribute	Description	Occurrence
assetType	The type of asset that changed. assetType is a required attribute. Valid Data Values: - Cutting Tool	1

246

247 **6.2 AssetRemoved Extension to Events**

248

249

250

**Figure 6: AssetRemoved Schema**

251

252 **AssetRemoved** An *MTConnect Asset* has been removed. The CDATA for the  
 253 **AssetRemoved** element **MUST** be the `assetId` of the *Asset* that has been  
 254 removed.

255 **6.2.1 AssetRemoved Attributes:**

Attribute	Description	Occurrence
assetType	The type of asset that was removed. assetType is a required attribute. Valid Data Values: - Cutting Tool	1

256

257 The *MTConnect Asset* will still be available if requested if the removed=true argument is sup-  
 258 plied. The `assetId` is provide as the CDATA value and can be used to request the *Asset* data  
 259 from the *MTConnect Agent*.

# MTConnect® Standard

## Part 4.1 – Cutting Tools

Version 1.4.0

Prepared for: MTConnect Institute

Prepared on: March 31, 2018

# MTConnect® Specification and Materials

AMT - The Association For Manufacturing Technology (“AMT”) owns the copyright in this MTConnect® Specification or Material. AMT grants to you a non-exclusive, non-transferable, revocable, non-sublicensable, fully-paid-up copyright license to reproduce, copy and redistribute this MTConnect® Specification or Material, provided that you may only copy or redistribute the MTConnect® Specification or Material in the form in which you received it, without modifications, and with all copyright notices and other notices and disclaimers contained in the MTConnect® Specification or Material.

If you intend to adopt or implement an MTConnect® Specification or Material in a product, whether hardware, software or firmware, which complies with an MTConnect® Specification, you **MUST** agree to the MTConnect® Specification Implementer License Agreement (“Implementer License”) or to the MTConnect® Intellectual Property Policy and Agreement (“IP Policy”). The Implementer License and IP Policy each sets forth the license terms and other terms of use for MTConnect® Implementers to adopt or implement the MTConnect® Specifications, including certain license rights covering necessary patent claims for that purpose. These materials can be found at [www.MTConnect.org](http://www.MTConnect.org), or by contacting [info@MTConnect.org](mailto:info@MTConnect.org).

MTConnect® Institute and AMT have no responsibility to identify patents, patent claims or patent applications which may relate to or be required to implement a Specification, or to determine the legal validity or scope of any such patent claims brought to their attention. Each MTConnect® Implementer is responsible for securing its own licenses or rights to any patent or other intellectual property rights that may be necessary for such use, and neither AMT nor MTConnect® Institute have any obligation to secure any such rights.

This Material and all MTConnect® Specifications and Materials are provided “as is” and MTConnect® Institute and AMT, and each of their respective members, officers, affiliates, sponsors and agents, make no representation or warranty of any kind relating to these materials or to any implementation of the MTConnect® Specifications or Materials in any product, including, without limitation, any expressed or implied warranty of noninfringement, merchantability, or fitness for particular purpose, or of the accuracy, reliability, or completeness of information contained herein. In no event shall MTConnect® Institute or AMT be liable to any user or implementer of MTConnect® Specifications or Materials for the cost of procuring substitute goods or services, lost profits, loss of use, loss of data or any incidental, consequential, indirect, special or punitive damages or other direct damages, whether under contract, tort, warranty or otherwise, arising in any way out of access, use or inability to use the MTConnect® Specification or other MTConnect® Materials, whether or not they had advance notice of the possibility of such damage.

## 1    1 Purpose of This Document

2    This document, *Part 4.1 – Cutting Tools* of the MTConnect® Standard, establishes the rules and  
3    terminology to be used by designers to describe the function and operation of Cutting Tools used  
4    within manufacturing and to define the data that is provided by an *MTConnect Agent* from a  
5    piece of equipment. This part of the Standard also defines the structure for the XML document  
6    that is returned from an *MTConnect Agent* in response to a *Probe* request.

7    The data associated with these Cutting Tools will be retrieved from multiple sources that are  
8    responsible for providing their knowledge of an *MTConnect Asset*.

9

## 10 **2 Terminology and Conventions**

- 11 Refer to *Section 2 of Part 1 - Overview and Functionality* for a dictionary of terms, reserved  
12 language, and document conventions used in the MTConnect Standard.

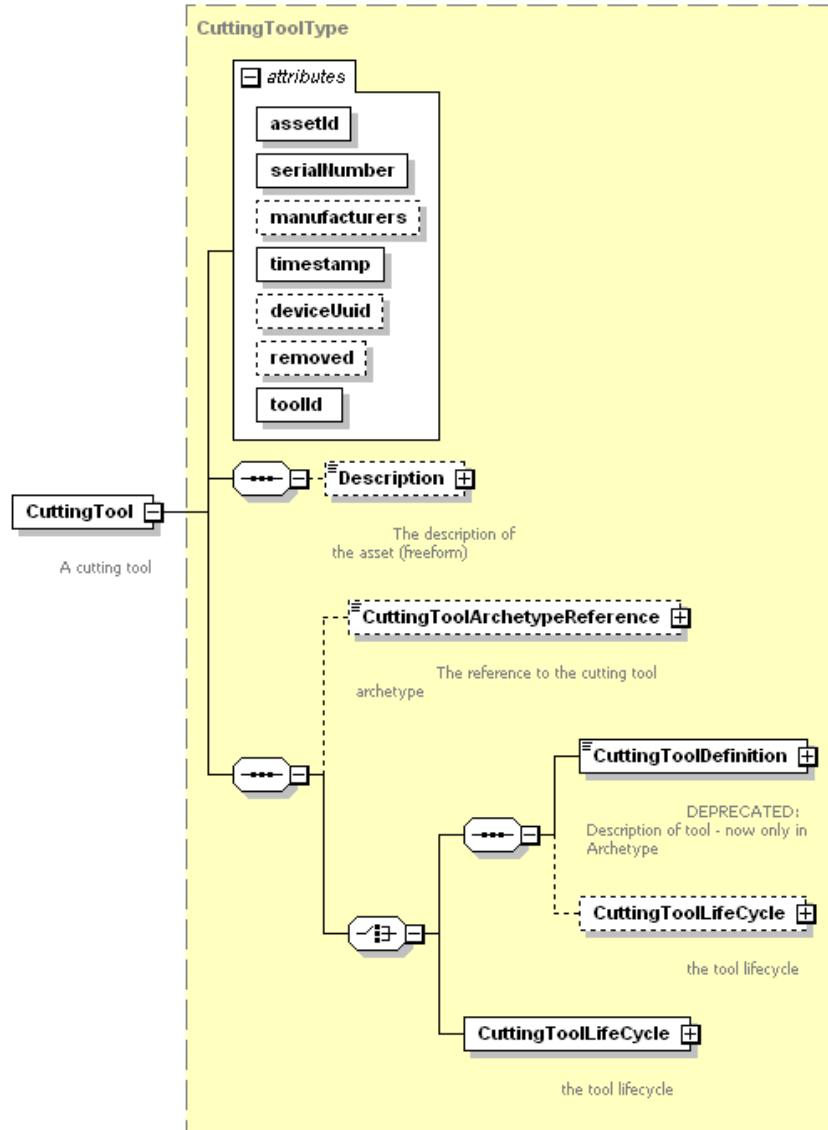

### 13    3 Cutting Tool and Cutting Tool Archetype

14    There are two *Information Models* used to represent a Cutting Tool, a  
15    `CuttingToolArchetype` and a `CuttingTool`. The `CuttingToolArchetype`  
16    represent the static Cutting Tool geometries and nominal values as one would expect from a tool  
17    catalog and the `CuttingTool` represents the use or application of the tool on the shop floor  
18    with actual measured values and process data. In Version 1.3.0 of the MTConnect Standard it  
19    was decided to separate out these two concerns since not all pieces of equipment will have access  
20    to both pieces of information. In this way, a generic definition of the Cutting Tool can coexist  
21    with a specific assembly information model with minimal redundancy of data.

22

23    **3.1 XML Schema Structure for CuttingTool and**  
 24    **CuttingToolArchetype**

25    The following figure shows the XML schema that applies to both the CuttingTool  
 26    *Information Model* and the CuttingToolArchetype *Information Model*.

27

Generated by XMLSpy

[www.altova.com](http://www.altova.com)

28

**Figure 1: CuttingTool Schema**

29

30    Note: The use of the XML element `CuttingToolDefinition` has been **DEPRECATED**  
 31    in the `CuttingTool` schema, but remains in the `CuttingToolArchetype`  
 32    schema.

33

34 The following sections contain the definitions of `CuttingTool` and  
 35 `CuttingToolArchetype` and describe their unique components. The following are the  
 36 common entities for both elements.

### 37 3.2 Common Attributes for `CuttingTool` and `CuttingToolArchetype`

Attribute	Description	Occurrence
<code>timestamp</code>	The time this <i>MTConnect Asset</i> was last modified. Always given in UTC. The timestamp <b>MUST</b> be provided in UTC (Universal Time Coordinate, also known as GMT). This is the time the <i>Asset</i> data was last modified.  <code>timestamp</code> is a required attribute.	1
<code>assetId</code>	The unique identifier of the instance of this tool. This will be the same as the <code>toolId</code> and <code>serialNumber</code> in most cases. The <code>assetId</code> <b>SHOULD</b> be the combination of the <code>toolId</code> and <code>serialNumber</code> as in <code>toolId.serialNumber</code> or an equivalent implementation dependent identification scheme.  <code>assetId</code> is a required attribute.  <code>assetId</code> is a permanent identifier that will be associated with an <i>MTConnect Asset</i> for its entire life.	1
<code>serialNumber</code>	The unique identifier for this assembly. This is defined as an XML string type and is implementation dependent.  <code>serialNumber</code> is a required attribute.	1
<code>toolId</code>	The identifier for a class of Cutting Tools. This is defined as an XML string type and is implementation dependent.  <code>toolId</code> is a required attribute.	1
<code>deviceUuid</code>	The piece of equipment UUID that supplied this data. This optional element references to the UUID attribute given in the <code>Device</code> element. This can be any series of numbers and letters as defined by the XML type <code>NMTOKEN</code> .	1
<code>manufacturers</code>	An optional attribute referring to the manufacturer(s) of this Cutting Tool, for this element, this will reference the Tool Item and Adaptive Items specifically. The Cutting Items manufacturers' will be an attribute of the <code>CuttingItem</code> elements. The representation will be a comma (,) delimited list of manufacturer names. This can be any series of numbers and letters as defined by the XML type <code>string</code> .	0..1

Attribute	Description	Occurrence
removed	<p>This is an indicator that the Cutting Tool has been removed from the piece of equipment.</p> <p>removed is an optional attribute.</p> <p>If the <i>MTConnect Asset</i> is marked as removed, it will not be visible to the client application unless the <code>includeRemoved=true</code> parameter is provided in the URL. If this attribute is not present it <b>MUST</b> be assumed to be false. The value is an <code>xsi:boolean</code> type and <b>MUST</b> be true or false.</p>	0..1

38

### 3.3 Common Elements for `CuttingTool` and `CuttingToolArchetype`

40

Element	Description	Occurrence
Description	An element that can contain any descriptive content. This can contain configuration information and manufacturer specific details. This element is defined to contain mixed content and XML elements can be added to extend the descriptive semantics of the MTConnect Standard.	0..1

41

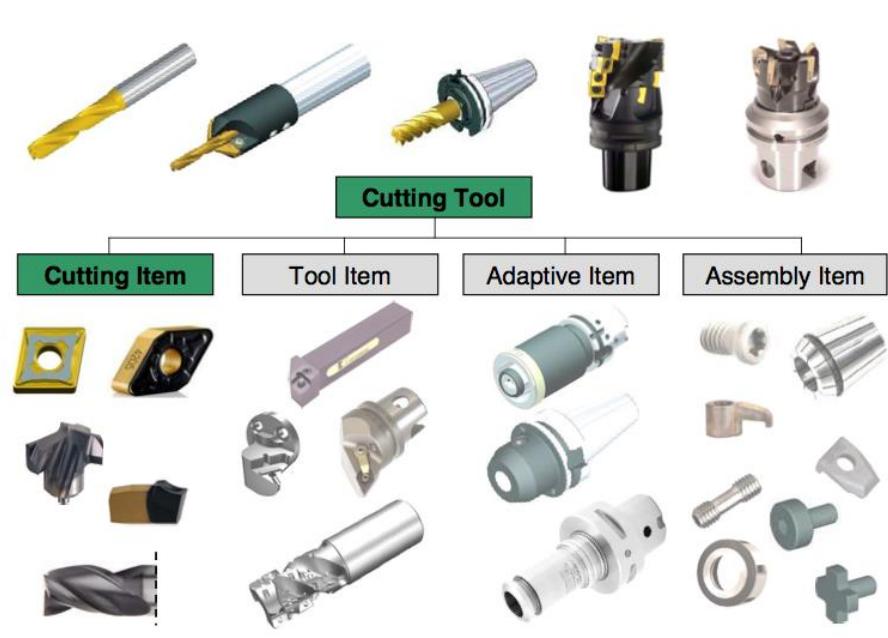

#### 3.3.1 Description Element for `CuttingTool` and `CuttingToolArchetype`

Description **MAY** contain mixed content, meaning that an additional XML element or plain text may be provided as part of the content of the description tag. Currently Description contains no attributes.

## 47    4 CuttingToolArchetype Information Model

48    The CuttingToolArchetype *Information Model* will have the identical structure as the  
 49    CuttingTool *Information Model* illustrated in *Figure 1*, except for a few entities. The  
 50    CuttingTool will no longer carry the CuttingToolDefinition, this **MUST** only  
 51    appear in the CuttingToolArchetype. The CuttingToolArchetype **MUST NOT**  
 52    have measured values and **MUST NOT** have any of the following items: CutterStatus,  
 53    ToolLife values, Location, or a ReconditionCount.

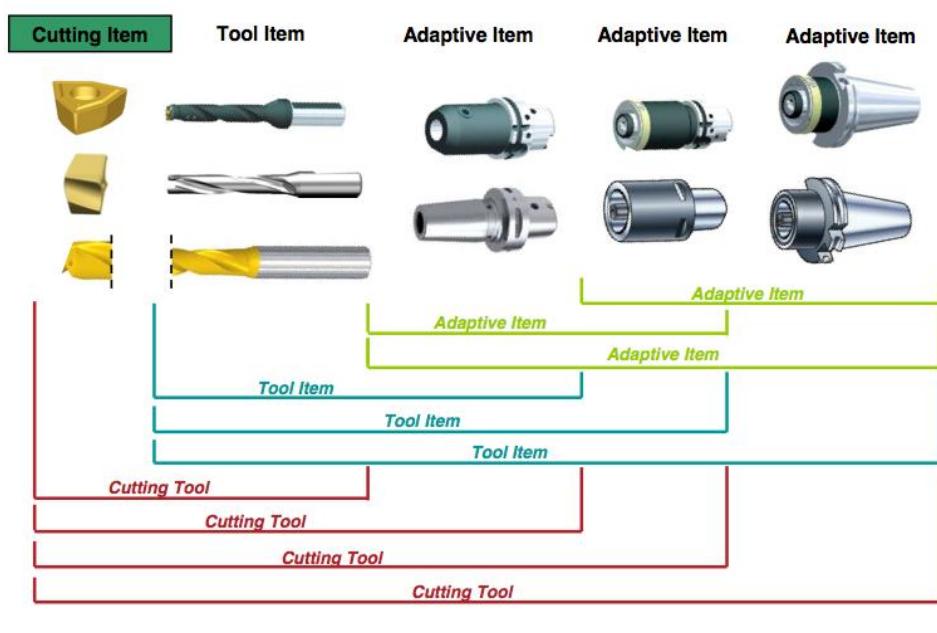

54    MTConnect Standard will adopt the ISO 13399 structure when formulating the vocabulary for  
 55    Cutting Tool geometries and structure to be represented in the CuttingToolArchetype.  
 56    The nominal values provided in the CuttingToolLifeCycle section are only concerned  
 57    with two aspects of the Cutting Tool, the Cutting Tool and the Cutting Item. The Tool Item,  
 58    Adaptive Item, and Assembly Item will only be covered in the CuttingToolDefinition  
 59    section of this document since this section contains the full ISO 13399 information about a  
 60    Cutting Tool.

61  
62  
63  
64

Figure 2: Cutting Tool Parts

65 The previous diagram illustrates the parts of a Cutting Tool. The Cutting Tool is the aggregate of  
 66 all the components and the Cutting Item is the part of the tool that removes the material from the  
 67 workpiece. These are the primary focus of the MTConnect Standard.

68

69 **Figure 3: Cutting Tool Composition**

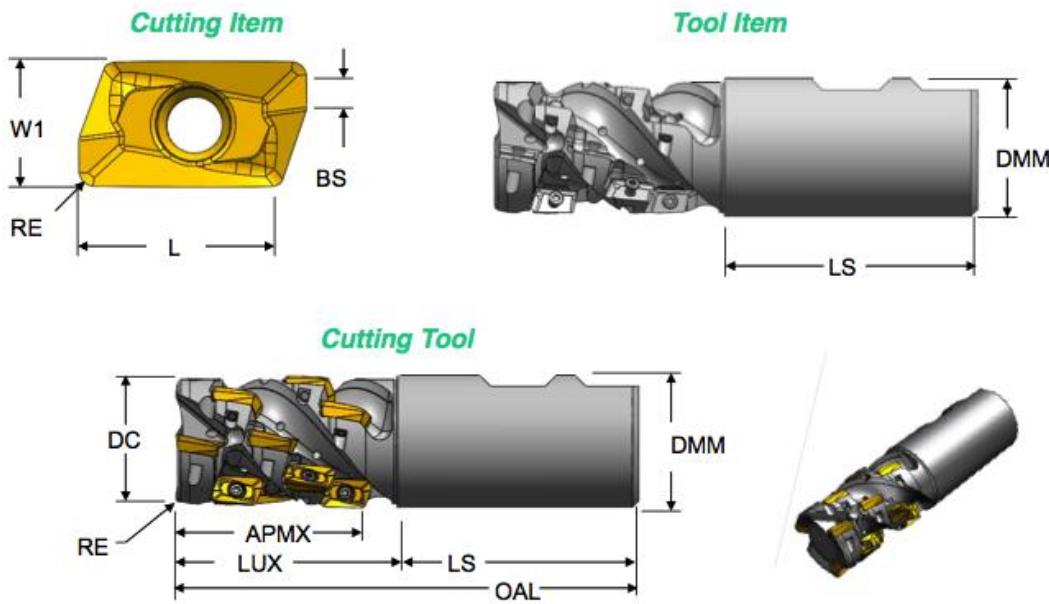

70

71 *Figure 3* provides another view of the composition of a Cutting Tool. The Adaptive Items and  
 72 Tool Items will be used for measurements, but will not be modeled as separate entities. When  
 73 we are referencing the Cutting Tool we are referring to the entirety of the assembly and when we  
 74 provide data regarding the Cutting Item we are referencing each individual item as illustrated on  
 75 the left of the previous diagram.

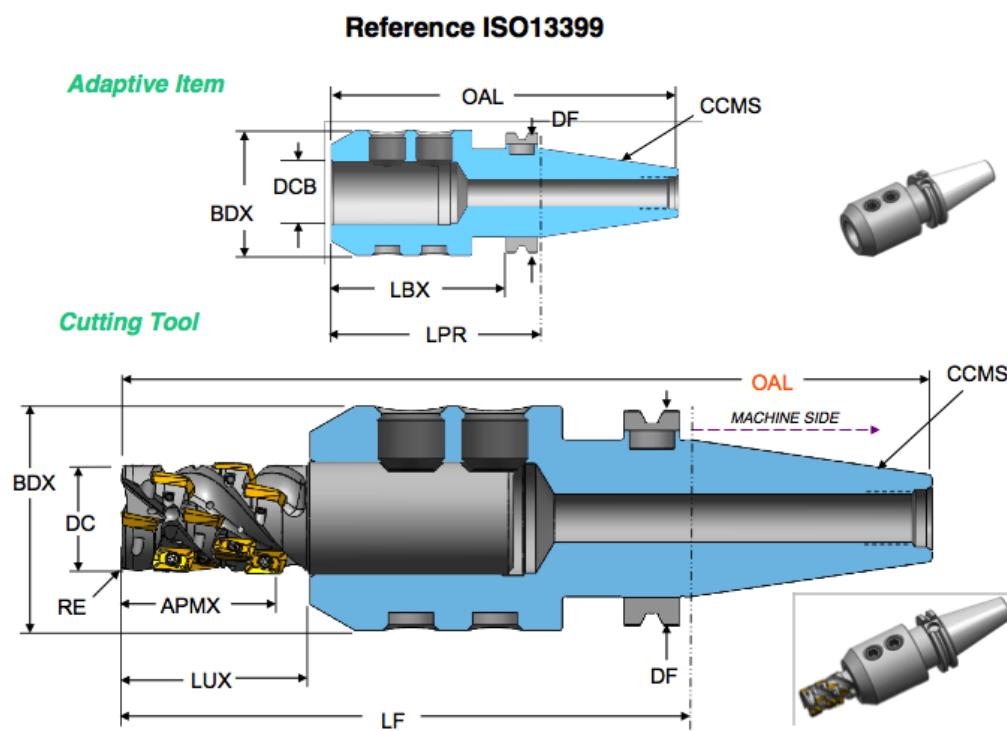

76

77 Figures 4 and 5 further illustrates the components of the Cutting Tool. As we compose the Tool  
 78 Item, Cutting Item, Adaptive Item, we get a Cutting Tool. The Tool Item, Adaptive Item, and  
 79 Assembly Item will only be in the CuttingToolDefinition section that will contain the  
 80 full ISO 13399 information.

### Reference ISO13399

81  
 82 **Figure 4: Cutting Tool, Tool Item and Cutting Item**  
 83

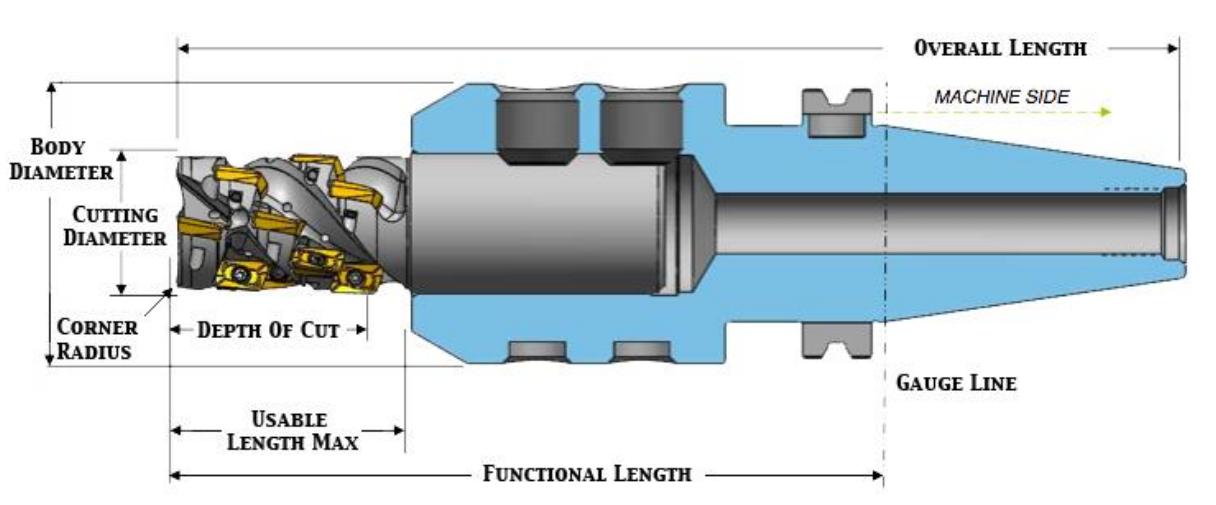

84

85

86

87 The above diagrams use the ISO 13399 codes for each of the measurements. These codes will be  
 88 translated into the MTConnect Standard vocabulary as illustrated below. The measurements will  
 89 have a maximum, minimum, and nominal value representing the tolerance of allowable values  
 90 for this dimension. See below for a full discussion.

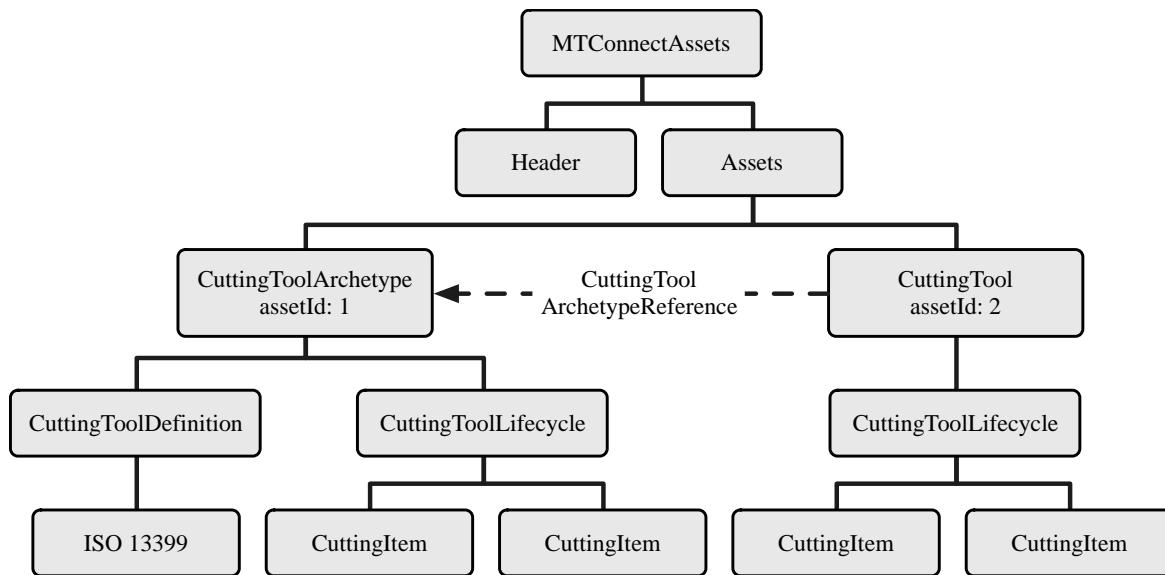

91

**Figure 6: Cutting Tool Measurements**

93  
94 The MTConnect Standard will not define the entire geometry of the Cutting Tool, but will  
95 provide the information necessary to use the tool in the manufacturing process. Additional  
96 information can be added to the definition of the Cutting Tool by means of schema extensions.

97 Additional diagrams will reference these dimensions by their codes that will be defined in the  
98 measurement tables. The codes are consistent with the codes used in ISO 13399 and have been  
99 standardized. MTConnect Standard will use the full text name for clarity in the XML document.

**Figure 7: Cutting Tool Asset Structure**

101  
102  
103

104 The structure of the MTConnectAssets header is defined in *Part 1 - Overview and*  
 105 *Fundamentals* of the Standard. A finite number of *MTConnect Assets* will be stored in the  
 106 *MTConnect Agent*. This finite number is implementation specific and will depend on memory  
 107 and storage constraints. The standard will not prescribe the number or capacity requirements for  
 108 an implementation.

## 109 **4.1 Attributes for CuttingToolArchetype**

110 Refer to *Section 3.2* for a full description of the attributes for *CuttingToolArchetype*  
 111 *Information Model*.

## 112 **4.2 Elements for CuttingToolArchetype**

113 The elements associated with *CuttingToolArchetype* are given below. Each element will  
 114 be described in more detail below and any possible values will be presented with full definitions.  
 115 The elements **MUST** be provided in the following order as prescribed by XML. At least one of  
 116 *CuttingToolDefinition* or *CuttingToolLifeCycle* **MUST** be supplied.

117

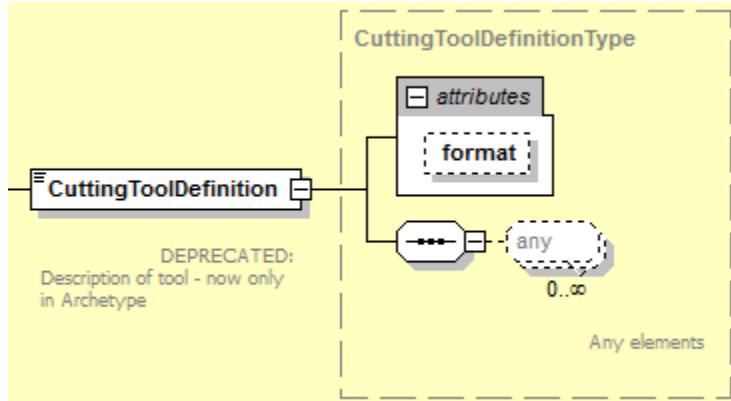

Element	Description	Occurrence
Description	An element that can contain any descriptive content. This can contain configuration information and manufacturer specific details. This element is defined to contain mixed content and XML elements can be added to extend the descriptive semantics of MTConnect Standard.	0..1
CuttingToolDefinition	Reference to an ISO 13399.	0..1
CuttingToolLifeCycle	Data regarding the use of this tool. The archetype will only contain nominal values.	0..1

118

119

120    **4.2.1 CuttingToolDefinition Element for**  
 121    **CuttingToolArchetype**

122

123

124    **Figure 8: CuttingToolDefinition Schema**

125

126    The CuttingToolDefinition contains the detailed structure of the Cutting Tool. The  
 127    information contained in this element will be static during its lifecycle. Currently we are  
 128    referring to the external ISO 13399 standard to provide the complete definition and composition  
 129    of the Cutting Tool as defined in *Section 6.1* of this document.

130    **4.2.1.1 Attributes for CuttingToolDefinition**

131

Attribute	Description	Occurrence
format	<p>Identifies the expected representation of the enclosed data.  <code>format</code> is an optional attribute.            Valid values of <code>format</code> are – EXPRESS, XML, TEXT, or UNDEFINED.            If <code>format</code> is not specified, the assumed format is XML.</p>	0..1

132

133

134 **4.2.1.1.1 format Attribute for CuttingToolDefinition**

135 The `format` attribute describes the expected representation of the enclosed data. If no value is  
 136 given, the assumed format will be XML.

Value	Description
XML	The default value for the definition. The content will be an XML document.
EXPRESS	The document will conform to the ISO 10303 Part 21 standard.
TEXT	The document will be a text representation of the tool data.
UNDEFINED	The document will be provided in an undefined format.

137

138 **4.2.1.2 Elements for CuttingToolDefinition**

139 The only acceptable Cutting Tool definition at present is defined by the ISO 13399 standard.  
 140 Additional formats **MAY** be considered in the future.

141 **4.2.1.3 ISO 13399 Standard**

142 The ISO 13399 data **MUST** be presented in either XML (ISO 10303-28) or EXPRESS format  
 143 (ISO 10303-21). An XML schema will be preferred as this will allow for easier integration with  
 144 the MTConnect Standard XML tools. EXPRESS will also be supported, but software tools will  
 145 need to be provided or made available for handling this data representation.

146 There will be the root element of the ISO13399 document when XML is used. When EXPRESS  
 147 is used the XML element will be replaced by the text representation.

148 **4.2.2 CuttingToolLifeCycle Element for CuttingToolArchetype**

149 Refer to *Section 6 – Common Entity CuttingToolLifeCycle* for a complete description of  
 150 `CuttingToolLifeCycle` element.

## 151 5 CuttingTool Information Model

152 The CuttingTool *Information Model* illustrated in *Figure 1* has the identical structure as the  
 153 CuttingToolArchetype *Information Model* except for the XML element  
 154 CuttingToolDefinition that has been **DEPRECATED** in the CuttingTool schema.

### 155 5.1 Attributes for CuttingTool

156 Refer to *Section 3.2* for a full description of the attributes for CuttingTool *Information*  
 157 *Model*.

### 158 5.2 Elements for CuttingTool

159 The elements associated with CuttingTool are given below. The elements **MUST** be  
 160 provided in the following order as prescribed by XML.

Element	Description	Occurrence
Description	An element that can contain any descriptive content. This can contain configuration information and manufacturer specific details. This element is defined to contain mixed content and XML elements can be added to extend the descriptive semantics of MTConnect Standard.	0..1
CuttingToolDefinition	<b>DEPRECATED</b> for CuttingTool in Version 1.3.0. Reference to an ISO 13399.	0..1
CuttingToolLifeCycle	Data regarding the use of this tool.	0..1
CuttingToolArchetypeReference	The content of this XML element is the assetId of the CuttingToolArchetype document. It <b>MAY</b> also contain a source attribute that gives the URL of the archetype data as well.	0..1

161

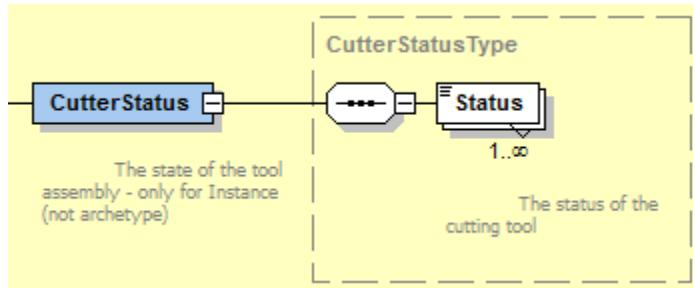

#### 162 5.2.1 CuttingToolLifeCycle Elements for CuttingTool Only

163 The following CuttingToolLifeCycle elements are used only in the CuttingTool  
 164 *Information Model* and are not part of the CuttingToolArchetype *Information Model*.  
 165 Refer to *Section 6* for a complete description of the remaining elements for  
 166 CuttingToolLifeCycle that are common in both *Information Models*. Refer also to the  
 167 CuttingToolLifeCycle schema illustrated in *Figure 12*.

168

169 **5.2.1.1 CutterStatus Element for CuttingToolLifeCycle**

170

171

**Figure 9: CutterStatus Schema**

173 The elements of the **CutterStatus** element can be a combined set of **Status** elements. The  
 174 MTConnect Standard allows any set of statuses to be combined, but only certain combinations  
 175 make sense. A Cutting Tool **SHOULD** not be both **NEW** and **USED** at the same time. There are  
 176 no rules in the schema to enforce this, but this is left to the implementer. The following  
 177 combinations **MUST NOT** occur:

- 178 • **NEW** **MUST NOT** be used with **USED**, **RECONDITIONED**, or **EXPIRED**.
- 179 • **UNKNOWN** **MUST NOT** be used with any other status.
- 180 • **ALLOCATED** and **UNALLOCATED** **MUST NOT** be used together.
- 181 • **AVAILABLE** and **UNAVAILABLE** **MUST NOT** be used together.
- 182 • If the tool is **EXPIRED**, **BROKEN**, or **NOT\_REGISTERED** it **MUST NOT** be  
 183 **AVAILABLE**.
- 184 • All other combinations are allowed.

185

Element	Description	Occurrence
Status	The status of the Cutting Tool. There can be multiple <b>Status</b> elements.	1..INF

186

187 **5.2.1.1.1 Status Element for CutterStatus**

188 One of the values for the status of the Cutting Tool.

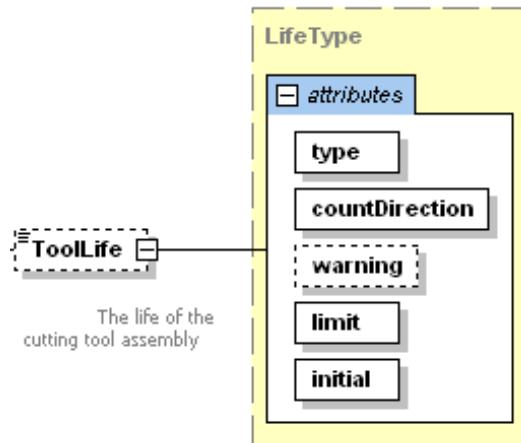

Value	Description
NEW	A new tool that has not been used or first use. Marks the start of the tool history.
AVAILABLE	Indicates the tool is available for use. If this is not present, the tool is currently not ready to be used.

Value	Description
UNAVAILABLE	Indicates the tool is unavailable for use in metal removal. If this is not present, the tool is currently not ready to be used.
ALLOCATED	Indicates if this tool is has been committed to a piece of equipment for use and is not available for use in any other piece of equipment. If this is not present, this tool has not been allocated for this piece of equipment and can be used by another piece of equipment.
UNALLOCATED	Indicates this Cutting Tool has not been committed to a process and can be allocated.
MEASURED	The tool has been measured.
RECONDITIONED	The Cutting Tool has been reconditioned. See ReconditionCount for the number of times this cutter has been reconditioned.
USED	The Cutting Tool is in process and has remaining tool life.
EXPIRED	The Cutting Tool has reached the end of its useful life.
BROKEN	Premature tool failure.
NOT_REGISTERED	This Cutting Tool cannot be used until it is entered into the system.
UNKNOWN	The Cutting Tool is an indeterminate state. This is the default value.

189

190 **5.2.1.2 ToolLife Element for CuttingToolLifeCycle**

191

192

193

**Figure 10: ToolLife Schema**

194 The value is the current value for the tool life. The value **MUST** be a number. **ToolLife** is an  
 195 option element which can have three types, either minutes for time based, part count for parts  
 196 based, or wear based using a distance measure. One tool life element can appear for each type,  
 197 but there cannot be two entries of the same type. Additional types can be added in the future.

198 **5.2.1.2.1 Attributes for **ToolLife****

199 **ToolLife** has the following attributes that can be used to indicate the behavior of the tool life  
 200 management mechanism.

Attribute	Description	Occurrence
type	The type of tool life being accumulated. MINUTES, PART_COUNT, or WEAR.  type is a required attribute.	1
countDirection	Indicates if the tool life counts from zero to maximum or maximum to zero. The value <b>MUST</b> be one of UP or DOWN.  countDirection is a required attribute.	1
warning	The point at which a tool life warning will be raised.  warning is an optional attribute.	0..1
limit	The end of life limit for this tool. If the countDirection is DOWN, the point at which this tool should be expired, usually zero. If the countDirection is UP, this is the upper limit for which this tool should be expired.  limit is a required attribute.	0..1
initial	The initial life of the tool when it is new.  initial is a required attribute.	0..1

201

202 **5.2.1.2.2 type Attribute for **ToolLife****

203 The value of type must be one of the following:

Value	Description
MINUTES	The tool life measured in minutes. All units for minimum, maximum, and nominal <b>MUST</b> be provided in minutes.
PART_COUNT	The tool life measured in parts. All units for minimum, maximum, and nominal <b>MUST</b> be provided as the number of parts.

Value	Description
WEAR	The tool life measured in tool wear. Wear <b>MUST</b> be provided in millimeters as an offset to nominal. All units for minimum, maximum, and nominal <b>MUST</b> be given as millimeter offsets as well. The standard will only consider dimensional wear at this time.

204

205 **5.2.1.2.3 countDirection Attribute for ToolLife**

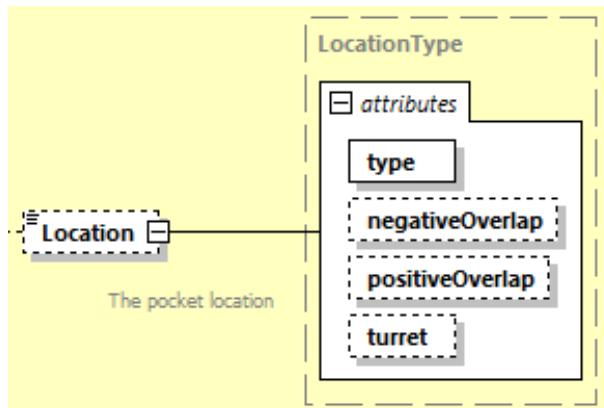

206 The value of type must be one of the following:

Value	Description
DOWN	The tool life counts down from the maximum to zero.
UP	The tool life counts up from zero to the maximum.

207

208 **5.2.1.3 Location Element for CuttingToolLifeCycle**

209

210

**Figure 11: Location Schema**

211

212  
 213 Location element identifies the specific location where a tool resides in a piece of equipment  
 214 tool storage or in a tool crib. This can be any series of numbers and letters as defined by the  
 215 XML type NMTOKEN. When a POT or STATION type is used, the value **MUST** be a numeric  
 216 value. If a negativeOverlap or the positiveOverlap is provided, the tool reserves  
 217 additional locations on either side, otherwise if they are not given, no additional locations are  
 218 required for this tool. If the pot occupies the first or last location, a rollover to the beginning or  
 219 the end of the index-able values may occur. For example, if there are 64 pots and the tool is in  
 220 pot 64 with a positiveOverlap of 1, the first pot **MAY** be occupied as well.

221 **5.2.1.3.1 Attributes for Location**

222

Attribute	Description	Occurrence
type	The type of location being identified. type <b>MUST</b> be one of POT, STATION, or CRIB. type is a required attribute.	1
positiveOverlap	The number of locations at higher index value from this location. positiveOverlap is an optional attribute.	0..1
negativeOverlap	The number of location at lower index values from this location. negativeOverlap is an optional attribute.	0..1

223

224 **5.2.1.3.2 Type Attribute for Location**

225 The type of location being identified.

Value	Description
POT	The number of the pot in the tool handling system.
STATION	The tool location in a horizontal turning machine.
CRIB	The location with regard to a tool crib.

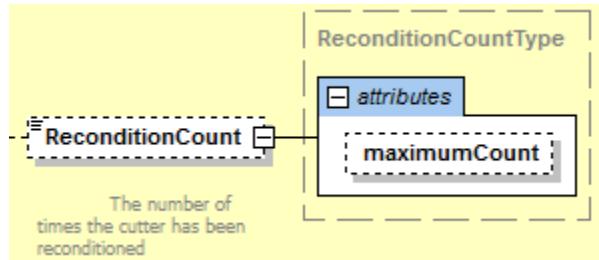

226

227 **5.2.1.3.3 positiveOverlap Attribute for Location**228 The number of locations at higher index values that the Cutting Tool occupies due to  
229 interference. The value **MUST** be an integer. If not provided it is assumed to be 0.230 **5.2.1.3.4 negativeOverlap Attribute for Location**231 The number of locations at lower index values that the Cutting Tool occupies due to interference.  
232 The value **MUST** be an integer. If not provided it is not assumed to be 0.233 The tool number assigned in the part program and is used for cross referencing this tool  
234 information with the process parameters. The value **MUST** be an integer.

235

236 **5.2.1.4 ReconditionCount Element for CuttingToolLifecycle**

237

238

**Figure 12: ReconditionCount Schema**

240

241 This element **MUST** contain an integer value as the CDATA that represents the number of times  
242 the cutter has been reconditioned.

243 **5.2.1.4.1 Attributes for ReconditionCount**

244

Attribute	Description	Occurrence
maximumCount	The maximum number of times this tool may be reconditioned. maximumCount is an optional attribute.	0..1

245

246 **5.2.2 CuttingToolArchetypeReference Element for**  
247 **CuttingTool**

248

249

Generated by XMLSpy

[www.altova.com](http://www.altova.com)

250

**Figure 13: CuttingToolArchetypeReference Schema**

251

252 This optional element references another *MTConnect Asset* document providing the static  
253 geometries and nominal values for all the measurements. This reduces the amount of data  
254 duplication as well as providing a mechanism for asset definitions to be provided before  
255 complete measurement has occurred.

256 **5.2.2.1 Source Attribute for CuttingToolArchetypeReference**

257

Attribute	Description	Occurrence
Source	The URL of the CuttingToolArchetype <i>Information Model</i> . This <b>MUST</b> be a fully qualified URL as in <a href="http://example.com/asset/A213155">http://example.com/asset/A213155</a>	0..1

258

## 259    **6 Common Entity CuttingToolLifeCycle**

### 260    **6.1 CuttingToolLifeCycle**

261    The life cycle refers to the data pertaining to the application or the use of the tool. This data is  
262    provided by various pieces of equipment (i.e. machine tool, presetter) and statistical process  
263    control applications. Life cycle data will not remain static, but will change periodically when a  
264    tool is used or measured. The life cycle has three conceptual parts; tool and Cutting Item  
265    identity, properties, and measurements. A measurement is defined as a constrained value that is  
266    reported in defined units and as a W3C floating point format.

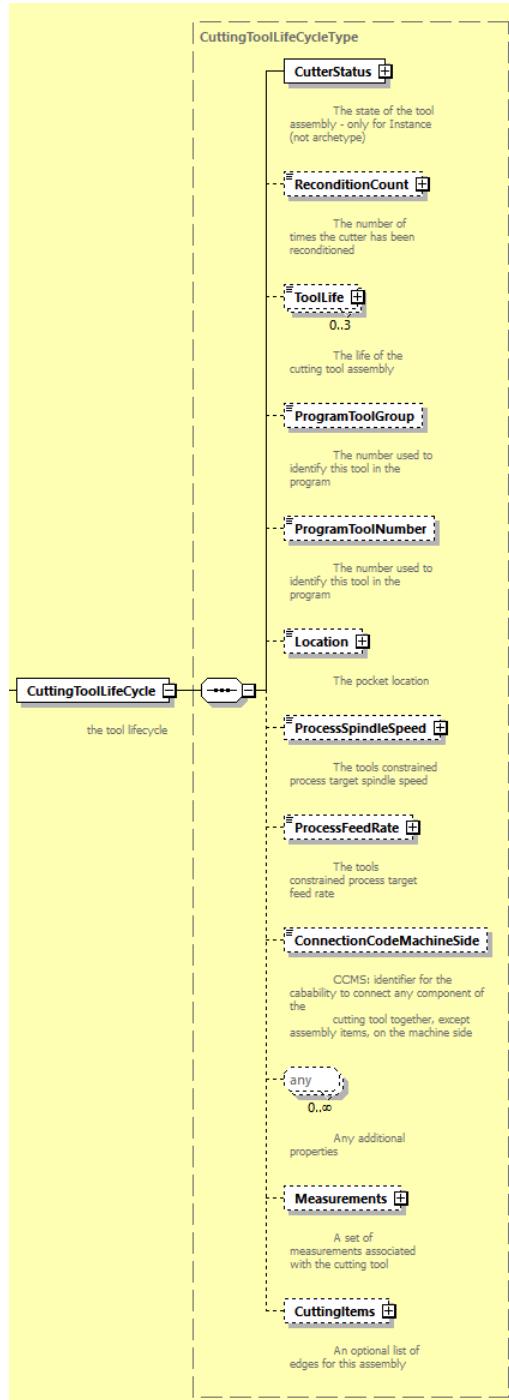

267    The CuttingToolLifeCycle contains data for the entire tool assembly. The specific  
268    Cutting Items that are part of the CuttingToolLifeCycle are contained in the  
269    CuttingItems element. Each Cutting Item has similar properties as the assembly; identity,  
270    properties, and measurements.

271    The units for all measurements have been predefined in the MTConnect Standard and will be  
272    consistent with *Part 2 – Devices Information Model* and *Part 3 – Streams Information Model* of  
273    the Standard. This means that all lengths and distances will be given in millimeters and all  
274    angular measures will be given in degrees. Quantities like ProcessSpindleSpeed will be  
275    given in RPM, the same as the RotaryVelocity in *Part 3 – Streams Information Model*.

276

277    **6.1.1 XML Schema Structure for CuttingToolLifeCycle**

278    The CuttingToolLifeCycle schema shown in *Figure 12* is used in both the  
 279    CuttingToolArchetype and CuttingTool *Information Models*. The only difference is  
 280    that the elements CutterStatus, ToolLife, Location, and ReconditionCount are  
 281    used only in the CuttingTool *Information Model*.

282

283

**Figure 14: CuttingToolLifeCycle Schema**

284 **6.2 Elements for CuttingToolLifeCycle**

285 The elements associated with this Cutting Tool are given below. Each element will be described  
 286 in more detail below and any possible values will be presented with full definitions. The  
 287 elements **MUST** be provided in the following order as prescribed by XML.

Element	Description	Occurrence
CutterStatus	<p>The status of this assembly.</p> <p>CutterStatus can be one of the following values : NEW, AVAILABLE, UNAVAILABLE, ALLOCATED, UNALLOCATED, MEASURED, RECONDITIONED, NOT_REGISTERED, USED, EXPIRED, BROKEN, or UNKNOWN.</p> <p><b>MUST</b> only be used in the <i>CuttingTool Information Model</i>.</p>	1
ReconditionCount	<p>The number of times this cutter has been reconditioned.</p> <p><b>MUST</b> only be used in the <i>CuttingTool Information Model</i>.</p>	0..1
ToolLife	<p>The Cutting Tool life as related to this assembly.</p> <p><b>MUST</b> only be used in the <i>CuttingTool Information Model</i>.</p>	0..1
Location	<p>The Pot or Spindle this tool currently resides in.</p> <p><b>MUST</b> only be used in the <i>CuttingTool Information Model</i>.</p>	0..1
ProgramToolGroup	The tool group this tool is assigned in the part program.	0..1
ProgramToolNumber	The number of the tool as referenced in the part program.	0..1
ProcessSpindleSpeed	The constrained process spindle speed for this tool.	0..1
ProcessFeedRate	The constrained process feed rate for this tool in mm/s.	0..1
ConnectionCodeMachineSide	Identifier for the capability to connect any component of the Cutting Tool together, except Assembly Items, on the machine side. Code: CCMS	0..1
Measurements	A collection of measurements for the tool assembly.	0..1
CuttingItems	An optional set of individual Cutting Items.	0..1
xs:any	Any additional properties not in the current document model. <b>MUST</b> be in separate XML namespace.	0..n

288

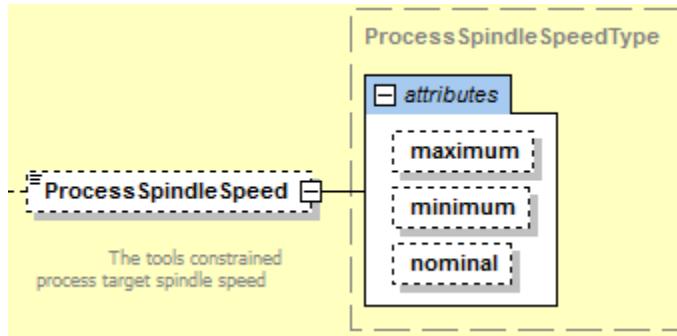

289    **6.2.1 ProgramToolGroup Element for CuttingToolLifeCycle**

290    The optional identifier for the group of Cutting Tools when multiple tools can be used  
 291    interchangeably. This is defined as an XML string type and is implementation dependent.

292    **6.2.2 ProgramToolNumber Element for CuttingToolLifeCycle**

293    The tool number assigned in the part program and is used for cross referencing this tool  
 294    information with the process parameters. The value **MUST** be an integer.

295    **6.2.3 ProcessSpindleSpeed Element for CuttingToolLifeCycle**

296

297    **Figure 15: ProcessSpindleSpeed Schema**

298

299    The **ProcessSpindleSpeed** **MUST** be specified in revolutions/minute (RPM). The CDATA  
 300    **MAY** contain the nominal process target spindle speed if available. The maximum and  
 301    minimum speeds **MAY** be provided as attributes. If **ProcessSpindleSpeed** is provided, at  
 302    least one value of maximum, nominal, or minimum **MUST** be specified.

303    **6.2.3.1 Attributes for ProcessSpindleSpeed**

304

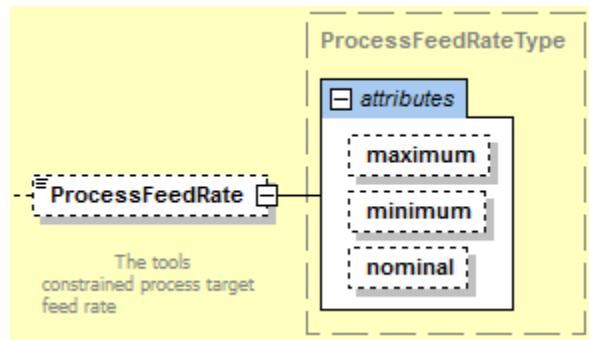

Attribute	Description	Occurrence
maximum	The upper bound for the tool's target spindle speed. maximum is an optional attribute.	0..1
minimum	The lower bound for the tools spindle speed. minimum is an optional attribute.	0..1
nominal	The nominal speed the tool is designed to operate at. nominal is an optional attribute.	0..1

305

306

307    **6.2.4 ProcessFeedRate Element for CuttingToolLifeCycle**

308

309

310    **Figure 16: ProcessFeedRate Schema**

311

312    The ProcessFeedRate **MUST** be specified in millimeters/second (mm/s). The CDATA  
 313    **MAY** contain the nominal process target feed rate if available. The maximum and minimum  
 314    rates **MAY** be provided as attributes. If ProcessFeedRate is provided, at least one value of  
 315    maximum, nominal, or minimum **MUST** be specified.

316    **6.2.4.1 Attributes for ProcessFeedRate**

317

Attribute	Description	Occurrence
maximum	The upper bound for the tool's process target feedrate. maximum is an optional attribute.	0..1
minimum	The lower bound for the tools feedrate. minimum is an optional attribute.	0..1
nominal	The nominal feedrate the tool is designed to operate at. nominal is and optional attribute.	0..1

318

319    **6.2.5 ConnectionCodeMachineSide Element for**  
320        **CuttingToolLifeCycle**

321    This is an optional identifier for implementation specific connection component of the Cutting  
 322    Tool on the machine side. Code: CCMS. The CDATA **MAY** be any valid string according to the  
 323    referenced connection code standards.

324    **6.2.6 xs:any Element for CuttingToolLifeCycle**

325    Utilizing the new capability in XMLSchema 1.1, we are now able to add extension points where  
 326    an additional element can be added to the document without being part of a substitution group.  
 327    The new elements have the restriction that they **MUST NOT** be part of the MTConnect  
 328    namespace and **MUST NOT** be one of the predefined elements mentioned above.

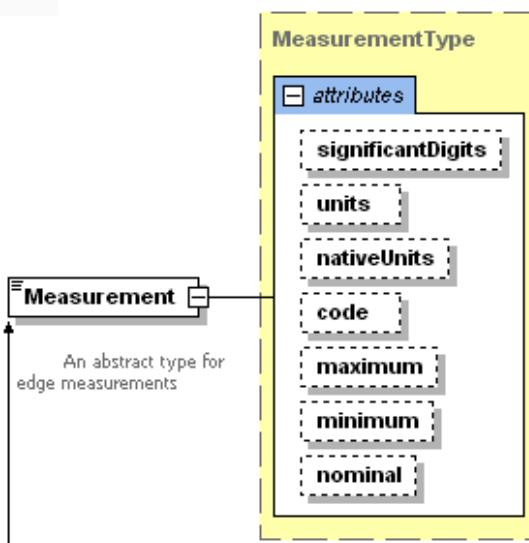

329    This will allow users to add additional properties to the Cutting Tool without having to change  
 330    the definition of the Cutting Tool or modify the standard. We will begin making use of this  
 331    capability in Version 1.3 of MTConnect Standard which will necessitate upgrading to Version 1.1  
 332    of XMLSchema.

333    **6.2.7 Measurements Element for CuttingToolLifeCycle**

334    The Measurements element is a collection of one or more constrained scalar values associated  
 335    with this Cutting Tool. The contents **MUST** be a subtype of CommonMeasurement or  
 336    AssemblyMeasurement. The following section will define the abstract Measurement  
 337    type used in both CuttingToolLifeCycle and CuttingItem. This section will then  
 338    describe the AssemblyMeasurement types. The CuttingItemMeasurement types will  
 339    be described at the end of the CuttingItem section.

340    A measurement is specific to a process and a machine tool at a particular shop. The tool zero  
 341    reference point or gauge line will be different depending on the particular implementation and  
 342    will be assumed to be consistent within the shop. MTConnect Standard does not standardize the  
 343    manufacturing process or the definition of the zero point.

344    **6.2.8 Measurement**

345  
 346    **Figure 17: Measurement Schema**  
 347

348 A measurement **MUST** be a scalar floating-point value that **MAY** be constrained to a maximum  
 349 and minimum value. Since the `CuttingToolLifeCycle`'s main responsibility is to track  
 350 aspects of the tool that change over its use in the shop, MTConnect represents the current value  
 351 of the measurement **MUST** be in the CDATA (text between the start and end element) as the most  
 352 current valid value.

353 The minimum and maximum **MAY** be supplied if they are known or relevant to the  
 354 measurement. A nominal value **MAY** be provided to show the reference value for this  
 355 measurement.

356 There are three subtypes of Measurement: `CommonMeasurement`,  
 357 `AssemblyMeasurement`, and `CuttingItemMeasurement`. These abstract types  
 358 **MUST NOT** appear in an `MTConnectAssets` document, but are used in the schema as a way  
 359 to separate which measurements **MAY** appear in the different sections of the document. Only  
 360 subtypes that have extended these types **MAY** appear in the `MTConnectAssets` XML.

361 Measurements in the `CuttingToolLifeCycle` section **MUST** refer to the entire assembly  
 362 and not to an individual Cutting Item. Cutting Item measurements **MUST** be located in the  
 363 measurements associated with the individual Cutting Item.

364 Measurements **MAY** provide an optional `units` attribute to reinforce the given units. The units  
 365 **MUST** always be given in the predefined MTConnect units. If units are provided, they are  
 366 only for documentation purposes. `nativeUnits` **MAY** optionally be provided to indicate the  
 367 original units provided for the measurements.

368 **6.2.8.1 Attributes for Measurement**

369

Attribute	Description	Occurrence
<code>code</code>	A shop specific code for this measurement. ISO 13399 codes <b>MAY</b> be used for these codes as well.  <code>code</code> is an optional attribute.	0..1
<code>maximum</code>	The maximum value for this measurement. Exceeding this value would indicate the tool is not usable.  <code>maximum</code> is an optional attribute.	0..1
<code>minimum</code>	The minimum value for this measurement. Exceeding this value would indicate the tool is not usable.  <code>minimum</code> is an optional attribute.	0..1
<code>nominal</code>	The as advertised value for this measurement.  <code>nominal</code> is an optional attribute.	0..1

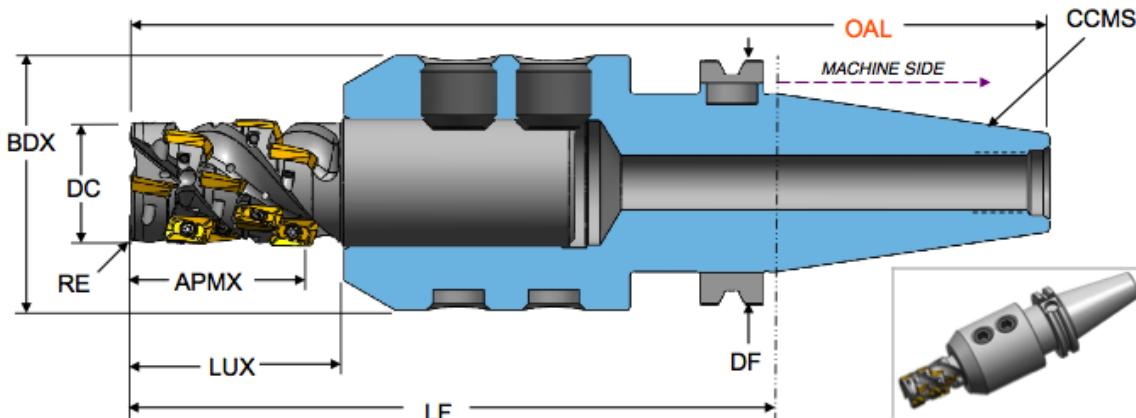

Attribute	Description	Occurrence
significantDigits	The number of significant digits in the reported value. This is used by applications to determine accuracy of values. This <b>MAY</b> be specified for all numeric values.  significantDigits is an optional attribute.	0..1
units	The units for the measurements. MTConnect Standard defines all the units for each measurement, so this is mainly for documentation sake. See <i>MTConnect Part 2 – Devices Information Model Section 7.2.2.5</i> for the full list of units.  units is an optional attribute.	0..1
nativeUnits	The units the measurement was originally recorded in. This is only necessary if they differ from units. See <i>MTConnect Part 2 – Devices Information Model Section 7.2.2.6</i> for the full list of units.  nativeUnits is an optional attribute.	0..1

370

### 371 6.2.8.2 Measurement Subtypes for CuttingToolLifeCycle

372 These measurements for CuttingTool are specific to the entire assembly and **MUST NOT** be  
 373 used for the measurement pertaining to a CuttingItem. The following diagram will be used  
 374 to reference the assembly specific measurements.

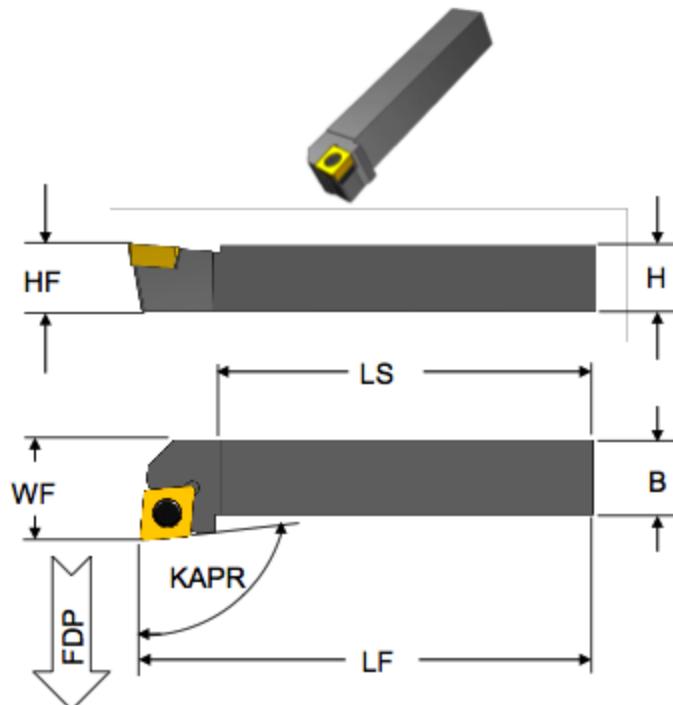

375 The Code in the following table will refer to the acronyms in the diagrams. We will be referring  
 376 to many diagrams to disambiguate all measurements of the CuttingTool and  
 377 CuttingItem.

378

379 **Figure 18: Cutting Tool Measurement Diagram 1**  
 380 **(Cutting Item, Tool Item, and Adaptive Item – ISO 13399)**

381

382

383

384

385

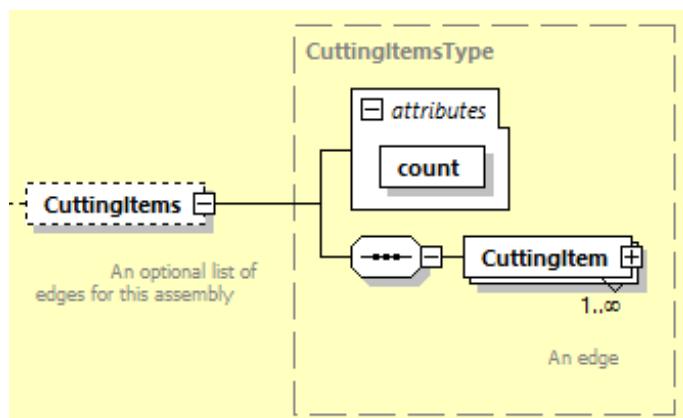

**Figure 19: Cutting Tool Measurement Diagram 2  
(Cutting Item, Tool Item, and Adaptive Item – ISO 13399)**

Measurement	Code	Description	Units
BodyDiameterMax	BDX	The largest diameter of the body of a Tool Item.	mm
BodyLengthMax	LBX	The distance measured along the X axis from that point of the item closest to the workpiece, including the Cutting Item for a Tool Item but excluding a protruding locking mechanism for an Adaptive Item, to either the front of the flange on a flanged body or the beginning of the connection interface feature on the machine side for cylindrical or prismatic shanks.	mm
DepthOfCutMax	APMX	The maximum engagement of the cutting edge or edges with the workpiece measured perpendicular to the feed motion.	mm
CuttingDiameterMax	DC	The maximum diameter of a circle on which the defined point Pk of each of the master inserts is located on a Tool Item. The normal of the machined peripheral surface points towards the axis of the Cutting Tool.	mm
FlangeDiameterMax	DF	The dimension between two parallel tangents on the outside edge of a flange.	mm

Measurement	Code	Description	Units
OverallToolLength	OAL	The largest length dimension of the Cutting Tool including the master insert where applicable.	mm
ShankDiameter	DMM	The dimension of the diameter of a cylindrical portion of a Tool Item or an Adaptive Item that can participate in a connection.	mm
ShankHeight	H	The dimension of the height of the shank.	mm
ShankLength	LS	The dimension of the length of the shank.	mm
UsableLengthMax	LUX	maximum length of a Cutting Tool that can be used in a particular cutting operation including the non-cutting portions of the tool.	mm
ProtrudingLength	LPR	The dimension from the yz-plane to the furthest point of the Tool Item or Adaptive Item measured in the -X direction.	mm
Weight	WT	The total weight of the Cutting Tool in grams. The force exerted by the mass of the Cutting Tool.	grams
FunctionalLength	LF	The distance from the gauge plane or from the end of the shank to the furthest point on the tool, if a gauge plane does not exist, to the cutting reference point determined by the main function of the tool. The CuttingTool functional length will be the length of the entire tool, not a single Cutting Item. Each CuttingItem can have an independent FunctionalLength represented in its measurements.	mm

386

## 387 6.2.9 CuttingItems Element for CuttingToolLifeCycle

388

389 **Figure 20: CuttingItems Schema**

390

391 An optional collection of Cutting Items that **SHOULD** be provided for each independent edge or  
 392 insert. If the **CuttingItems** are not present; it indicates there is no specific information with  
 393 respect to each of the Cutting Items. This does not imply there are no Cutting Items – there  
 394 **MUST** be at least one Cutting Item – but there is no specific information.

395 **6.2.9.1 Attributes for **CuttingItems****

396

Attribute	Description	Occurrence
count	The number of Cutting Items. count is a required attribute.	1

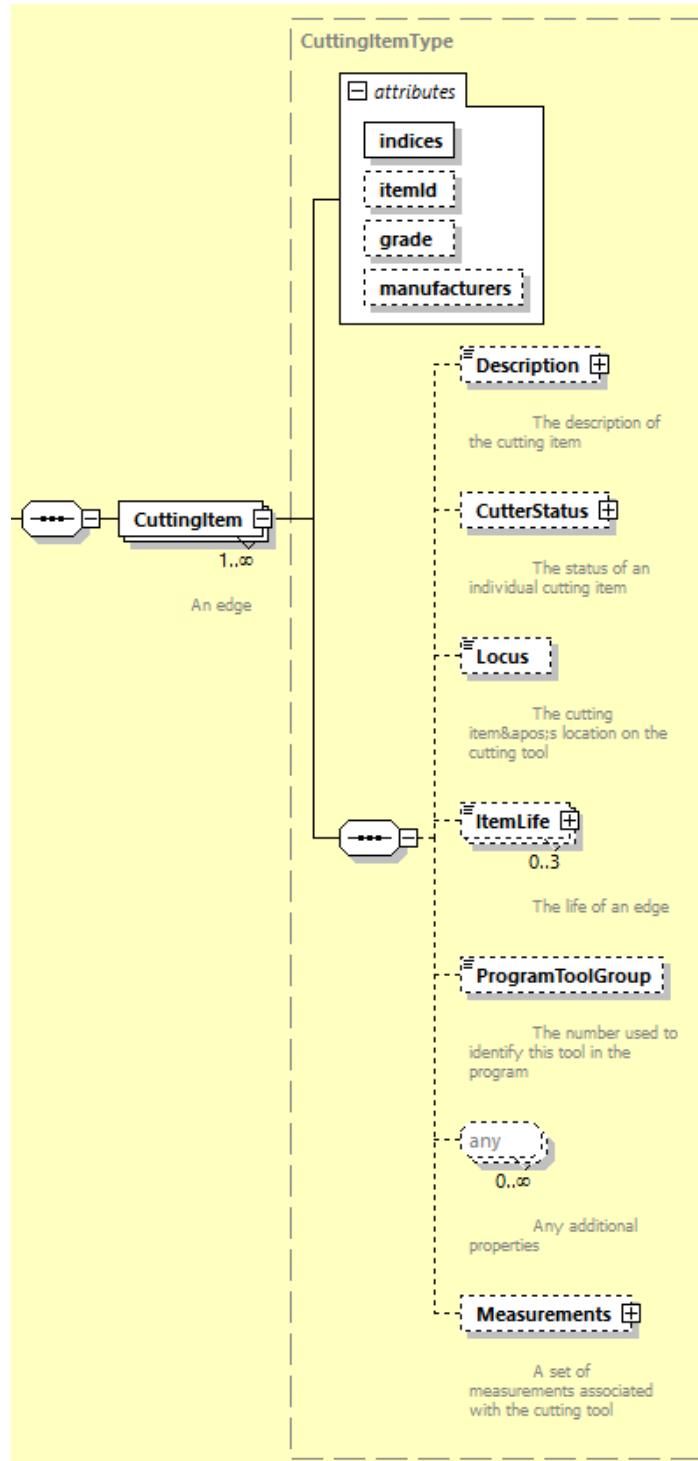

397

398 **6.2.10 **CuttingItem****

399 A Cutting Item is the portion of the tool that physically removes the material from the workpiece  
 400 by shear deformation. The Cutting Item can be either a single piece of material attached to the  
 401 Tool Item or it can be one or more separate pieces of material attached to the Tool Item using a  
 402 permanent or removable attachment. A Cutting Item can be comprised of one or more cutting  
 403 edges. Cutting Items include: replaceable inserts, brazed tips and the cutting portions of solid  
 404 Cutting Tools.

405

406 MTConnect Standard considers Cutting Items as part of the Cutting Tool. A Cutting Item **MUST**  
 407 **NOT** exist in MTConnect unless it is attached to a Cutting Tool. Some of the measurements,  
 408 such as FunctionalLength, **MUST** be made with reference to the entire Cutting Tool to be  
 409 meaningful.

410

411

**Figure 21: CuttingItem Schema**

412 **6.2.10.1 Attributes for CuttingItem**

413

Attribute	Description	Occurrence
indices	The number or numbers representing the individual Cutting Item or items on the tool.  indices is a required attribute	1
itemId	The manufacturer identifier of this Cutting Item.  itemId is an optional attribute.	0..1
manufacturers	The manufacturers of the Cutting Item.  manufacturers is an optional attribute.	0..1
grade	The material composition for this Cutting Item.  grade is an optional attribute.	0..1

414

415 **6.2.10.1.1 Indices Attribute for CuttingItem**

416 An identifier that indicates the Cutting Item or items these data are associated with. The value  
 417 **MUST** be a single number ("1") or a comma separated set of individual elements ("1,2,3,4"), or  
 418 as a inclusive range of values as in ("1-10") or any combination of ranges and numbers as in "1-  
 419 4,6-10,22". There **MUST NOT** be spaces or non-integer values in the text representation.

420 Indices **SHOULD** start numbering with the inserts or Cutting Item furthest from the gauge line  
 421 and increasing in value as the items get closer to the gauge line. Items at the same distance **MAY**  
 422 be arbitrarily numbered.

423 **6.2.10.1.2 itemId Attribute for CuttingItem**

424 The manufactures' identifier for this Cutting Item that **MAY** be its catalog or reference number.  
 425 The value **MUST** be an XML NMTOKEN value of numbers and letters.

426 **6.2.10.1.3 manufacturers Attribute for CuttingItem**

427 This optional element references the manufacturers of this tool. At this level the manufacturers  
 428 will reference the Cutting Item specifically. The representation will be a comma (,) delimited  
 429 list of manufacturer names. This can be any series of numbers and letters as defined by the XML  
 430 type string.

431 **6.2.10.1.4 grade Attribute for CuttingItem**

432 This provides an implementation specific designation for the material composition of this  
 433 Cutting Item.

434 **6.2.10.2 Elements for CuttingItem**

435

Element	Description	Occurrence
Description	A free-form description of the Cutting Item.	0..1
Locus	A free form description of the location on the Cutting Tool.	0..1
ItemLife	The life of this Cutting Item.	0..3
Measurements	A collection of measurements relating to this Cutting Item.	0..1

436

437 **6.2.10.2.1 Description Element for CuttingItem**

438 An optional free form text description of this Cutting Item.

439 **6.2.10.2.2 Locus Element for CuttingItem**

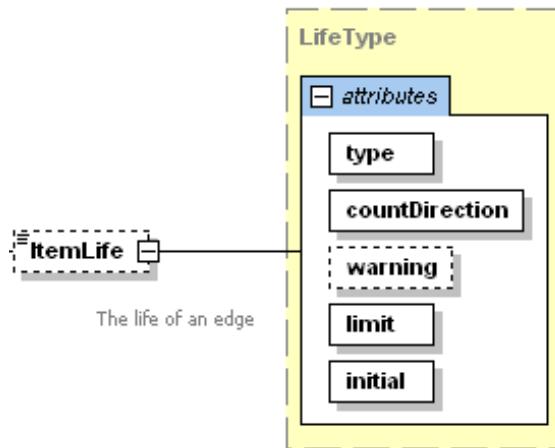

440 Locus represents the location of the Cutting Item with respect to the Cutting Tool. For clarity,  
 441 the words FLUTE, INSERT, and CARTRIDGE **SHOULD** be used to assist in noting the location  
 442 of a Cutting Item. The Locus **MAY** be any free form text, but **SHOULD** adhere to the following  
 443 rules:

- 444 1. The location numbering **SHOULD** start at the furthest Cutting Item (#1) and work it's  
 445 way back to the Cutting Item closest to the gauge line.
- 446 2. Flutes **SHOULD** be identified as such using the word FLUTE:. For example:  
 447     FLUTE: 1, INSERT: 2 - would indicate the first flute and the second furthest  
 448 insert from the end of the tool on that flute.
- 449 3. Other designations such as CARTRIDGE **MAY** be included, but should be identified  
 450 using upper case and followed by a colon (:).

451

452    **6.2.10.2.3 ItemLife Element for CuttingItem**

453

454

**Figure 22: Item Life**

455

456  
 457    The value is the current value for the tool life. The value **MUST** be a number. Tool life is an  
 458    option element which can have three types, either minutes for time based, part count for parts  
 459    based, or wear based using a distance measure. One tool life can appear for each type, but there  
 460    cannot be two entries of the same type. Additional types can be added in the future.

461    **6.2.10.2.4 Attributes for ItemLife**

462    These is an optional attribute that can be used to further classify the operation type.

Attribute	Description	Occurrence
<b>type</b>	The type of tool life being accumulated. <i>Valid Data Values:</i> MINUTES, PART_COUNT, or WEAR. <i>type</i> is a required attribute.	1
<b>countDirection</b>	Indicates if the tool life counts from zero to maximum or maximum to zero. The values <b>MUST</b> be one of UP or DOWN. <i>countDirection</i> is a required attribute.	1
<b>warning</b>	The point at which a tool life warning will be raised. <i>warning</i> is an optional attribute.	0..1

Attribute	Description	Occurrence
limit	The end of life limit for this tool. If the countDirection is DOWN, the point at which this tool should be expired, usually zero. If the countDirection is UP, this is the upper limit for which this tool should be expired.  limit is an optional attribute.	0..1
initial	The initial life of the tool when it is new.  initial is an optional attribute.	0..1

463

#### 464 6.2.10.2.5 type Attribute for ItemLife

465 The value of type must be one of the following:

Value	Description
MINUTES	The tool life measured in minutes. All units for minimum, maximum, and nominal <b>MUST</b> be provided in minutes.
PART_COUNT	The tool life measured in parts. All units for minimum, maximum, and nominal <b>MUST</b> be provided supplied as the number of parts.
WEAR	The tool life measured in tool wear. Wear <b>MUST</b> be provided in millimeters as an offset to nominal. All units for minimum, maximum, and nominal <b>MUST</b> be given as millimeter offsets as well.

466

#### 467 6.2.10.2.6 countDirection Attribute for ItemLife

468 The value of type must be one of the following:

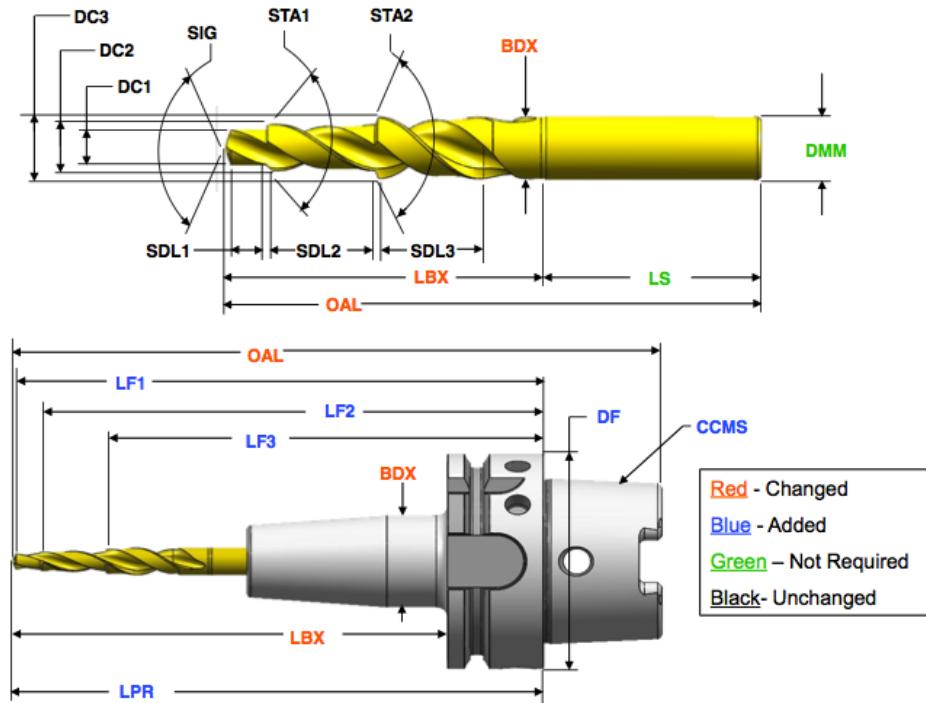

Value	Description
DOWN	The tool life counts down from the maximum to zero.
UP	The tool life counts up from zero to the maximum.

469

#### 470 6.2.10.3 Measurement Subtypes for CuttingItem

471 These measurements for CuttingItem are specific to an individual Cutting Item and **MUST**  
 472 **NOT** be used for the measurement pertaining to an assembly. The following diagram will be  
 473 used to for reference for the Cutting Item specific measurements.

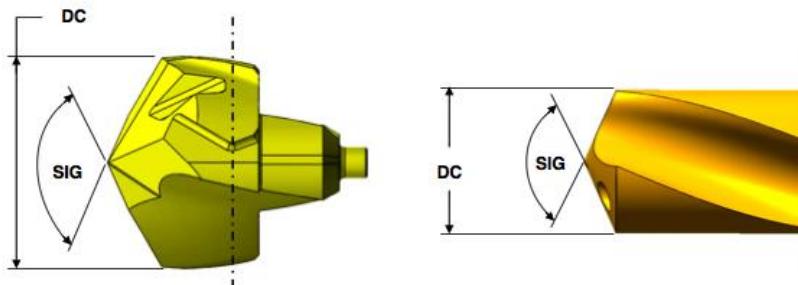

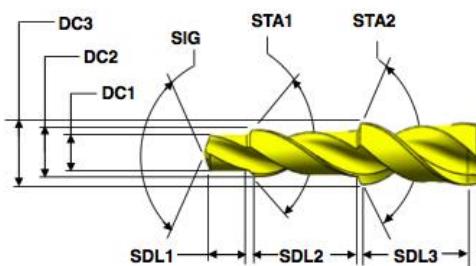

474 The Code in the following table will refer to the acronym in the diagram. We will be referring to  
 475 many diagrams to disambiguate all measurements of the Cutting Tools and Items. We will  
 476 present a few here; please refer to *Appendix B* for additional reference material.

477

(Cutting Item – ISO 13399)**

486

487

488

489

490 The following CuttingItem Measurements will refer the diagram above.

491

Measurement Subtype	Code	Description	Units
CuttingReferencePoint	CRP	The theoretical sharp point of the Cutting Tool from which the major functional dimensions are taken.	mm

Measurement Subtype	Code	Description	Units
CuttingEdgeLength	L	The theoretical length of the cutting edge of a Cutting Item over sharp corners.	mm
DriveAngle	DRVA	Angle between the driving mechanism locator on a Tool Item and the main cutting edge	degree
FlangeDiameter	DF	The dimension between two parallel tangents on the outside edge of a flange.	mm
FunctionalWidth	WF	The distance between the cutting reference point and the rear backing surface of a turning tool or the axis of a boring bar.	mm
InscribedCircleDiameter	IC	The diameter of a circle to which all edges of a equilateral and round regular insert are tangential.	mm
PointAngle	SIG	The angle between the major cutting edge and the same cutting edge rotated by 180 degrees about the tool axis.	degree
ToolCuttingEdgeAngle	KAPR	The angle between the tool cutting edge plane and the tool feed plane measured in a plane parallel the xy-plane.	degree
ToolLeadAngle	PSIR	The angle between the tool cutting edge plane and a plane perpendicular to the tool feed plane measured in a plane parallel the xy-plane.	degree
ToolOrientation	N/A	The angle of the tool with respect to the workpiece for a given process. The value is application specific.	degree
WiperEdgeLength	BS	The measure of the length of a wiper edge of a Cutting Item.	mm
StepDiameterLength	SDLx	The length of a portion of a stepped tool that is related to a corresponding cutting diameter measured from the cutting reference point of that cutting diameter to the point on the next cutting edge at which the diameter starts to change.	mm
StepIncludedAngle	STAx	The angle between a major edge on a step of a stepped tool and the same cutting edge rotated 180 degrees about its tool axis.	degree
CuttingDiameter	DCx	The diameter of a circle on which the defined point Pk located on this Cutting Tool. The normal of the machined peripheral surface points towards the axis of the Cutting Tool.	mm

Measurement Subtype	Code	Description	Units
CuttingHeight	HF	The distance from the basal plane of the Tool Item to the cutting point.	mm
CornerRadius	RE	The nominal radius of a rounded corner measured in the X Y-plane.	mm
Weight	WT	The total weight of the Cutting Tool in grams. The force exerted by the mass of the Cutting Tool.	grams
FunctionalLength	LFX	The distance from the gauge plane or from the end of the shank of the Cutting Tool, if a gauge plane does not exist, to the cutting reference point determined by the main function of the tool. This measurement will be with reference to the Cutting Tool and <b>MUST NOT</b> exist without a Cutting Tool.	mm
ChamferFlatLength	BCH	The flat length of a chamfer.	mm
ChamferWidth	CHW	The width of the chamfer	mm
InsertWidth	W1	W1 is used for the insert width when an inscribed circle diameter is not practical.	mm

492

# MTConnect® Standard

## Part 5.0 – Interfaces

Version 1.4.0

Prepared for: MTConnect Institute

Prepared on: March 31, 2018

# MTConnect® Specification and Materials

AMT - The Association For Manufacturing Technology (“AMT”) owns the copyright in this MTConnect® Specification or Material. AMT grants to you a non-exclusive, non-transferable, revocable, non-sublicensable, fully-paid-up copyright license to reproduce, copy and redistribute this MTConnect Specification or Material, provided that you may only copy or redistribute the MTConnect Specification or Material in the form in which you received it, without modifications, and with all copyright notices and other notices and disclaimers contained in the MTConnect Specification or Material.

If you intend to adopt or implement an MTConnect Specification or Material in a product, whether hardware, software or firmware, which complies with an MTConnect Specification, you MUST agree to the MTConnect Specification Implementer License Agreement (“Implementer License”) or to the MTConnect Intellectual Property Policy and Agreement (“IP Policy”). The Implementer License and IP Policy each sets forth the license terms and other terms of use for MTConnect Implementers to adopt or implement the MTConnect Specifications, including certain license rights covering necessary patent claims for that purpose. These materials can be found at [www.MTConnect.org](http://www.MTConnect.org), or by contacting [info@MTConnect.org](mailto:info@MTConnect.org).

MTConnect Institute and AMT have no responsibility to identify patents, patent claims or patent applications which may relate to or be required to implement a Specification, or to determine the legal validity or scope of any such patent claims brought to their attention. Each MTConnect Implementer is responsible for securing its own licenses or rights to any patent or other intellectual property rights that may be necessary for such use, and neither AMT nor MTConnect Institute have any obligation to secure any such rights.

This Material and all MTConnect Specifications and Materials are provided “as is” and MTConnect Institute and AMT, and each of their respective members, officers, affiliates, sponsors and agents, make no representation or warranty of any kind relating to these materials or to any implementation of the MTConnect Specifications or Materials in any product, including, without limitation, any expressed or implied warranty of non-infringement, merchantability, or fitness for particular purpose, or of the accuracy, reliability, or completeness of information contained herein. In no event shall MTConnect Institute or AMT be liable to any user or implementer of MTConnect Specifications or Materials for the cost of procuring substitute goods or services, lost profits, loss of use, loss of data or any incidental, consequential, indirect, special or punitive damages or other direct damages, whether under contract, tort, warranty or otherwise, arising in any way out of access, use or inability to use the MTConnect Specification or other MTConnect Materials, whether or not they had advance notice of the possibility of such damage.

## 39    1 Purpose of This Document

40    This document, *Part 5.0 – Interfaces* of the MTConnect® Standard, defines a structured data  
41    model used to organize information required to coordinate inter-operations between pieces of  
42    equipment.

43    This data model is based on an *Interaction Model* that defines the exchange of information  
44    between pieces of equipment and is organized in the MTConnect Standard as the XML element  
45    *Interfaces*.

46    *Interfaces* is modeled as an extension to the MTConnectDevices and MTConnectStreams  
47    XML documents. *Interfaces* leverages similar rules and terminology as those used to  
48    describe a component in the MTConnectDevices XML document. *Interfaces* also uses  
49    similar methods for reporting data to those used in the MTConnectStreams XML document.

50    As defined in *Part 2.0 – Devices Information Model*, *Interfaces* is modeled as a *Top Level*  
51    component in the MTConnectDevices document (see *Figure 3* below). Each individual  
52    *Interface* XML element is modeled as a *Lower Level* component of *Interfaces*. The  
53    data associated with each *Interface* is modeled within each *Lower Level* component.

54

55    Note: See *Part 2.0 – Device Information Model* and *Part 3.0 - Streams Information Model* of  
56    the MTConnect Standard for information on how *Interfaces* is structured in the  
57    XML documents which are returned from an *MTConnect Agent* in response to a  
58    *Probe*, *Sample*, or *Current* request.

59

## 60    **2 Terminology and Conventions**

61    Refer to *Section 5 of Part 1.0 - Overview and Functionality* for a dictionary of terms, reserved  
62    language, and document conventions used in the MTConnect® Standard.

### 63    3 Interfaces Overview

64    In many manufacturing processes, multiple pieces of equipment must work together to perform a  
 65    task. The traditional method for coordinating the activities between individual pieces of  
 66    equipment is to connect them together using a series of signal wires to communicate equipment  
 67    states and demands for action. These interactions are usually accomplished by using simple  
 68    binary ON/OFF signals.

69    In the MTConnect® Standard, *Interfaces* provides a means to replace this traditional method for  
 70    interconnecting pieces of equipment with a structured *Interaction Model* that provides a rich set  
 71    of information used to coordinate the actions between pieces of equipment. Implementers may  
 72    utilize the information provided by this data model to (1) realize the interaction between pieces  
 73    of equipment and (2) to extend the functionality of the equipment to improve the overall  
 74    performance of the manufacturing process.

75    The *Interaction Model* used to implement *Interfaces* provides a lightweight and efficient  
 76    protocol, simplifies failure recovery scenarios, and defines a structure for implementing a Plug-  
 77    And-Play relationship between pieces of equipment. By standardizing the information exchange  
 78    using this higher level semantic information model, an implementer may more readily replace a  
 79    piece of equipment in a manufacturing system with any other piece of equipment capable of  
 80    providing similar *Interaction Model* functions.

81    Two primary functions are required to implement the *Interaction Model* for *Interfaces* and  
 82    manage the flow of information between pieces of equipment. Each piece of equipment needs to  
 83    have:

- 84    • An *MTConnect Agent* which provides:
  - 85      - The data required to implement the *Interaction Model*.
  - 86      - Any other data from a piece of equipment needed to implement the *Interface* –  
 87       operating states of the equipment, position information, execution modes, process  
 88       information, etc.
- 89    • A client software application that enables the piece of equipment to acquire and interpret  
 90       information from another piece of equipment.

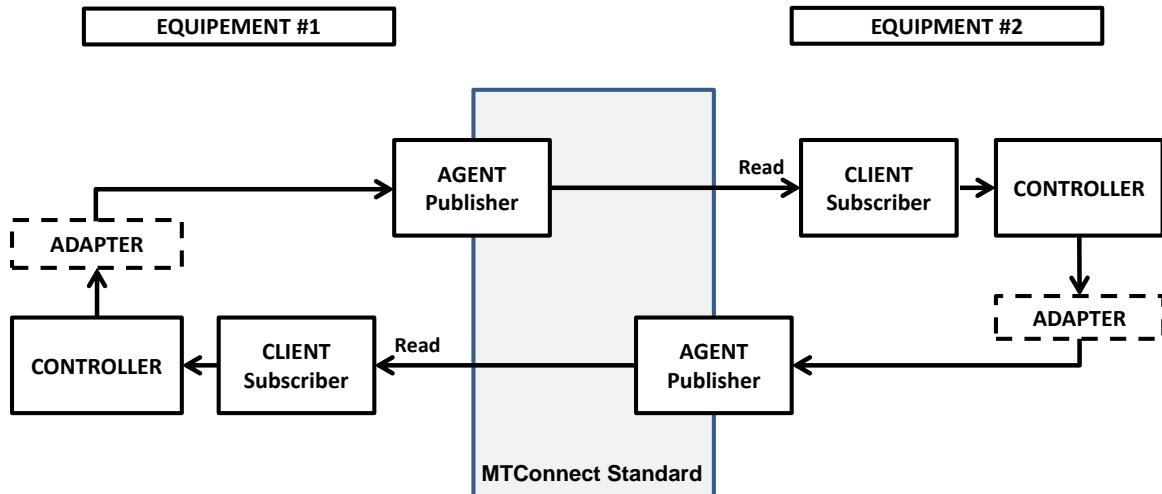

#### 91    3.1 *Interfaces* Architecture

92    MTConnect Standard is based on a communications method that provides no direct way for one  
 93    piece of equipment to change the state of, or cause an action to occur by, another piece of  
 94    equipment. The *Interaction Model* used to implement *Interfaces* is based on a *Publish/Subscribe*  
 95    type of communications as described in *Part I – Overview and Functionality* and utilizes a  
 96    *Request* and *Response* information exchange mechanism. For *Interfaces*, pieces of equipment  
 97    must perform both the publish (*MTConnect Agent*) and subscribe (client) functions.

98    Note: The current definition of *Interfaces* addresses the interaction between two pieces of  
 99    equipment. Future releases of the MTConnect Standard may address the interaction  
 100   between multiple (more than two) pieces of equipment.

101 The diagram below provides a high-level overview of a typical system architecture used to  
 102 implement *Interfaces*.

103

104

105 **Figure 1: Data Flow Architecture for *Interfaces***

106

107 Note: The data flow architecture illustrated in *Figure 1* above was historically referred to in  
 108 the MTConnect Standard as a read-read concept.

109 In the implementation of the *Interaction Model for Interfaces*, two pieces of equipment can  
 110 exchange information in the following manner. One piece of equipment indicates a *Request* for  
 111 service by publishing a type of *Request* using a data item provided through an *MTConnect Agent*  
 112 as defined in *Section 4* below. The client associated with a second piece of equipment, which is  
 113 subscribing to data from the first machine, detects and interprets that *Request*. If the second  
 114 machine chooses to take an action to fulfill this *Request*, it can indicate its acceptance by  
 115 publishing a *Response* using a data item provided through its *MTConnect Agent*. The client on  
 116 the first piece of equipment will continue to monitor information from the second piece of  
 117 equipment until it detects an indication that the *Response* to the *Request* has been completed or  
 118 has failed.

119 An example of this type of interaction between pieces of equipment can be represented by a  
 120 machine tool that wants material to be loaded by a robot. In this example, the machine tool is the  
 121 *Requester* and the robot is the *Responder*. On the other hand, if the robot wants the machine tool  
 122 to open a door, the robot becomes the *Requester* and the machine tool the *Responder*.

### 123 **3.2 Request and Response Information Exchange**

124 The concept of a *Request* and *Response* information exchange is not unique to MTConnect  
 125 *Interfaces*. This style of communication is used in many different types of environments and  
 126 technologies.

127

128 An early version of a *Request* and *Response* information exchange was used by early sailors.  
129 When it was necessary to communicate between two ships before radio communications were  
130 available, or when secrecy was required, a sailor on each ship could communicate with the other  
131 using flags as a signaling device to request information or actions. The responding ship could  
132 acknowledge those requests for action and identify when the requested actions were completed.

133 The same basic *Request* and *Response* concept is implemented by MTConnect *Interfaces* using  
134 the EVENT data items defined in *Section 4*.

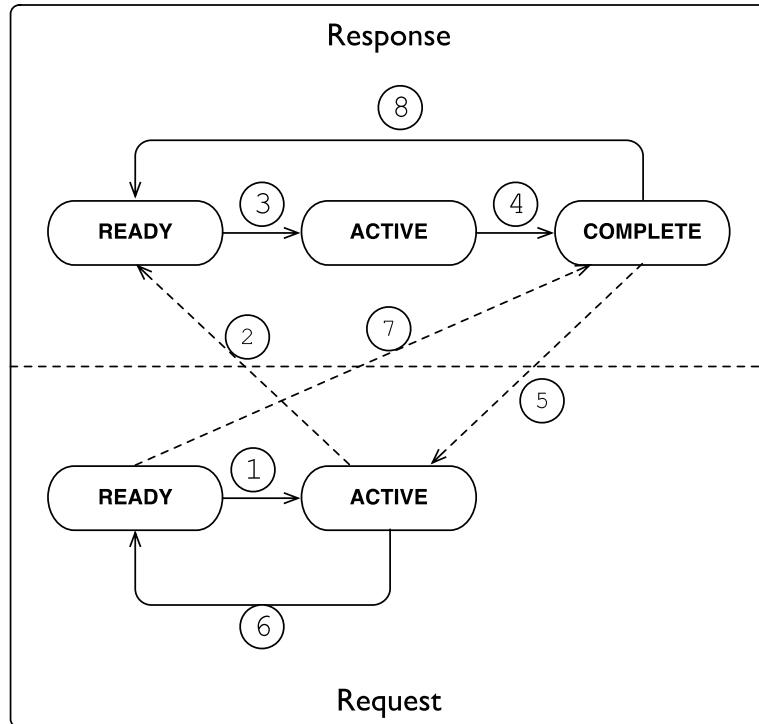

135 The DataItem elements defined by the *Interaction Model* each have a Request and  
136 Response subtype. These subtypes identify if the data item represents a *Request* or a  
137 *Response*. Using these data items, a piece of equipment changes the state of its *Request* or  
138 *Response* to indicate information that can be read by the other piece of equipment. To aid in  
139 understanding how the *Interaction Model* functions, one can view this *Interaction Model* as a  
140 simple state machine.

141 The interaction between two pieces of equipment can be described as follows. When the  
142 *Requester* wants an activity to be performed, it transitions its *Request* state from a READY state  
143 to an ACTIVE state. In turn, when the client on the *Responder* reads this information and  
144 interprets the *Request*, the *Responder* announces that it is performing the requested task by  
145 changing its response state to ACTIVE. When the action is finished, the *Responder* changes its  
146 response state to COMPLETE. This pattern of *Request* and *Response* provides the basis for the  
147 coordination of actions between pieces of equipment. These actions are implemented using  
148 EVENT category data items. (See *Section 4* for details on the Event type data items defined for  
149 *Interfaces*.)

150 Note: The implementation details of how the *Responder* piece of equipment reacts to the  
151 *Request* and then completes the requested task are up to the implementer.

152

153 The diagram below provides an example of the *Request* and *Response* state machine:

154

155

156

157 The initial condition of both the *Request* and *Response* states on both pieces of equipment is  
158 **READY**. The dotted lines indicate the on-going communications that occur to monitor the  
159 progress of the interactions between the pieces of equipment.

160

161 The interaction between the pieces of equipment as illustrated in *Figure 2* progresses through the  
 162 following sequence:

Step	Description
1	The <i>Request</i> transitions from READY to ACTIVE signaling that a service is needed.
2	The <i>Response</i> detects the transition of the <i>Request</i> .
3	The <i>Response</i> transitions from READY to ACTIVE indicating that it is performing the action.
4	Once the action has been performed, the <i>Response</i> transitions to COMPLETE.
5	The <i>Request</i> detects the action is COMPLETE.
6	The <i>Request</i> transitions back to READY acknowledging that the service has been performed.
7	The <i>Response</i> detects the <i>Request</i> has returned to READY.
8	In recognition of this acknowledgement, the <i>Response</i> transitions back to READY.

163

164 After the final action has been completed, both pieces of equipment are back in the READY state  
 165 indicating that they are able to perform another action.

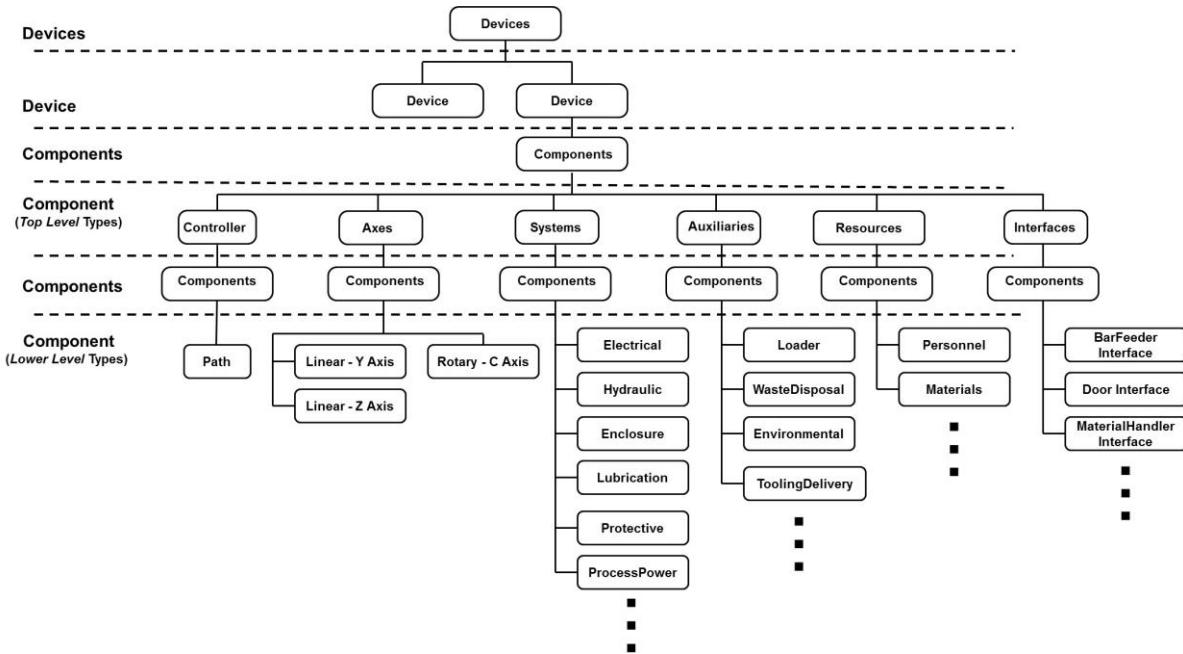

## 166 4 Interfaces for Devices and Streams Information Models

167 The *Interaction Model* for implementing *Interfaces* is defined in the MTConnect® Standard as an  
168 extension to the MTConnectDevices and MTConnectStreams XML documents.

169 A piece of equipment **MAY** support multiple different *Interfaces*. Each piece of equipment  
170 supporting *Interfaces* **MUST** organize the information associated with each *Interface* in a *Top*  
171 *Level* component called `Interfaces`. Each individual *Interface* is modeled as a *Lower Level*  
172 component called `Interface`. *Interface* is an abstract type XML element and will be  
173 replaced in the XML documents by specific `Interface` types defined below. The data  
174 associated with each *Interface* is modeled as data items within each of these *Lower Level*  
175 `Interface` components.

176 The following XML tree illustrates where `Interfaces` is modeled in the *Device Information*  
177 *Model* for a piece of equipment.

178

179

180 **Figure 3: Interfaces as a Structural Element**

181

182

183 **4.1 Interfaces**

184 *Interfaces* is an XML *Structural Element* in the MTConnectDevices XML document.  
185 *Interfaces* is a container type XML element. *Interfaces* is used to group information  
186 describing *Lower Level Interface* XML elements, which each provide information for an  
187 individual *Interface*.

188 If the *Interfaces* container appears in the XML document, it **MUST** contain one or more  
189 *Interface* type XML elements.

190 **4.2 Interface**

191 *Interface* is the next level of *Structural Element* in the MTConnectDevices XML  
192 document. As an abstract type XML element, *Interface* will be replaced in the XML  
193 documents by specific *Interface* types defined below.

194 Each *Interface* is also a container type element. As a container, the *Interface* XML  
195 element is used to organize information required to implement the *Interaction Model* for an  
196 *Interface*. It also provides structure for describing the *Lower Level Structural Elements*  
197 associated with the *Interface*. Each *Interface* contains *Data Entities* available from the  
198 piece of equipment that may be needed to coordinate activities with associated pieces of  
199 equipment.

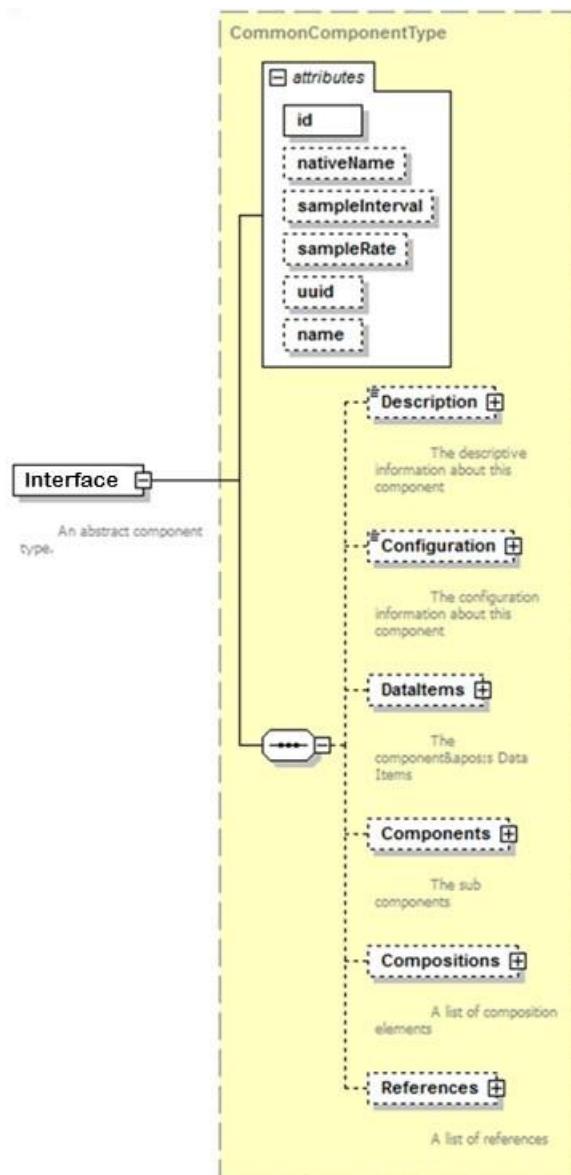

200 The information provided by a piece of equipment for each *Interface* is returned in a  
201 *ComponentStream* container of an MTConnectStreams document in the same manner as  
202 all other types of components.

203

204    **4.2.1 XML Schema Structure for Interface**

205    The following XML schema represents the structure of an `Interface` XML element.

206    The schema for an `Interface` element is the same as defined for `Component` elements  
 207    described in *Section 4.4* in *Part 2.0 – Devices Information Model* of the MTConnect Standard.  
 208    The figure below shows the attributes defined for `Interface` and the elements that may be  
 209    associated with `Interface`.

210

211

**Figure 4: Interface Schema**

212

213    Refer to *Part 2.0 – Devices Information Model*, *Section 4.4* for complete descriptions of the  
 214    attributes and elements that are illustrated above for `Interface`.

215    **4.2.2 Interface Types**

216    As an abstract type XML element, `Interface` is replaced in the `MTConnectDevices`  
 217    document with a XML element representing a specific type of *Interface*. An initial list of  
 218    `Interface` types is defined below.

Interface	Description
BarFeederInterface	<p>BarFeederInterface provides the set of information used to coordinate the operations between a Bar Feeder and another piece of equipment.</p> <p>Bar Feeder is a piece of equipment that pushes bar stock (i.e., long pieces of material of various shapes) into an associated piece of equipment – most typically a lathe or turning center.</p>
MaterialHandlerInterface	<p>MaterialHandlerInterface provides the set of information used to coordinate the operations between a piece of equipment and another associated piece of equipment used to automatically handle various types of materials or services associated with the original piece of equipment.</p> <p>A material handler is a piece of equipment capable of providing any one, or more, of a variety of support services for another piece of equipment or a process:</p> <ul style="list-style-type: none"> <li>Loading/unloading material or tooling</li> <li>Part inspection</li> <li>Testing</li> <li>Cleaning</li> <li>Etc.</li> </ul> <p>A robot is a common example of a material handler.</p>
DoorInterface	<p>DoorInterface provides the set of information used to coordinate the operations between two pieces of equipment, one of which controls the operation of a door.</p> <p>The piece of equipment that is controlling the door <b>MUST</b> provide the data item <code>Door_State</code> as part of the set of information provided.</p>
ChuckInterface	<p>ChuckInterface provides the set of information used to coordinate the operations between two pieces of equipment, one of which controls the operation of a chuck.</p> <p>The piece of equipment that is controlling the chuck <b>MUST</b> provide the data item <code>Chuck_State</code> as part of the set of information provided.</p>

219

220    Note: Additional `Interface` types may be defined in future releases of the MTConnect  
 221    Standard.

222    In order to implement the *Interaction Model* for *Interfaces*, each piece of equipment associated  
 223    with an `Interface` **MUST** provide an `Interface` XML element for that type of *Interface*. A  
 224    piece of equipment **MAY** support any number of unique *Interfaces*.

225 **4.2.3 Data for Interface**

226 Each *Interface* **MUST** provide (1) the data associated with the specific *Interface* to implement  
227 the *Interaction Model* and (2) any additional data that may be needed by another piece of  
228 equipment to understand the operating states and conditions of the first piece of equipment as it  
229 applies to the *Interface*.

230 Details on data items specific to the *Interaction Model* for each type of *Interface* are provided in  
231 *Section 4.2.4*.

232 An implementer may choose any other data available from a piece of equipment to describe the  
233 operating states and other information needed to support an *Interface*.

234 **4.2.3.1 References for Interface**

235 Some of the data items needed to support a specific *Interface* may already be defined elsewhere  
236 in the XML document for a piece of equipment. However, the implementer may not be able to  
237 directly associate this data with the *Interface* since the MTConnect Standard does not permit  
238 multiple occurrences of a piece of data to be configured in a XML document. **References**  
239 provides a mechanism for associating information defined elsewhere in the *Information Model*  
240 for a piece of equipment with a specific *Interface*.

241 **References** is an XML container that organizes pointers to information defined elsewhere in  
242 the XML document for a piece of equipment. **References** **MAY** contain one or more  
243 Reference XML elements.

244 **Reference** is an XML element that provides an individual pointer to information that is  
245 associated with another *Structural Element* or *Data Entity* defined elsewhere in the XML  
246 document that is also required for an *Interface*.

247 **References** is an economical syntax for providing interface specific information without  
248 directly duplicating the occurrence of the data. It provides an efficient, near-time, information  
249 flow between pieces of equipment.

250 For more information on the definition for **References** and **Reference**, see *Section 4.7* and  
251 *4.8 of Part 2.0 - Devices Information Model*.

252 **4.2.4 Data Items for Interface**

253 Each *Interface* XML element contains data items which are used to communicate  
254 information required to execute the *Interface*. When these data items are read by another piece  
255 of equipment, that piece of equipment can then determine the actions that it may take based upon  
256 that data.

257 Some data items **MAY** be directly associated with the *Interface* element and others will be  
258 organized in a *Lower Level References* XML element.

259 It is up to an implementer to determine which additional data items are required for a particular  
260 *Interface*.

261 The data items that have been specifically defined to support the implementation of an *Interface*  
 262 are provided below.

263 **4.2.4.1 INTERFACE\_STATE for Interface**

264 INTERFACE\_STATE is a data item specifically defined for *Interfaces*. It defines the  
 265 operational state of the *Interface*. This is an indicator identifying whether the *Interface* is  
 266 functioning or not.

267 An INTERFACE\_STATE data item **MUST** be defined for every Interface XML element.

268 INTERFACE\_STATE is reported in the MTConnectStreams XML document as  
 269 InterfaceState. InterfaceState reports one of two states – ENABLED or  
 270 DISABLED, which are provided in the CDATA for InterfaceState.

271 The table below shows both the INTERFACE\_STATE data item as defined in the  
 272 MTConnectDevices document and the corresponding *Element Name* that **MUST** be reported  
 273 in the MTConnectStreams document.

EVENT <b>Data Item Type</b>	Event <i>Element Name</i>	Description and <b>Valid Data Values</b>
INTERFACE_STATE	InterfaceState	<p>The current functional or operational state of an Interface type element indicating whether the <i>Interface</i> is active or not currently functioning.</p> <p>Valid Data Values:</p> <ul style="list-style-type: none"> <li>- ENABLED: The <i>Interface</i> is currently operational and performing as expected.</li> <li>- DISABLED: The <i>Interface</i> is currently not operational.</li> </ul> <p>When the INTERFACE_STATE is DISABLED, the state of all data items that are specific for the <i>Interaction Model</i> associated with that <i>Interface</i> <b>MUST</b> be set to NOT_READY.</p>

274

275

276    **4.2.4.2 Specific Data Items for the *Interaction Model for Interface***

277    A special set of data items have been defined to be used in conjunction with *Interface* type  
278    elements. When modeled in the MTConnectDevices document, these data items are all *Data*  
279    *Entities* in the EVENT category (See Part 3.0 – Streams Information Model for details on how  
280    the corresponding data items are reported in the MTConnectStreams document). They  
281    provide information from a piece of equipment to *Request* a service to be performed by another  
282    associated piece of equipment; and for the associated piece of equipment to indicate its progress  
283    in performing its *Response* to the *Request* for service.

284    Many of the data items describing the services associated with an *Interface* are paired to describe  
285    two distinct actions – one to *Request* an action to be performed and a second to reverse the action  
286    or to return to an original state. For example, a DoorInterface will have two actions  
287    OPEN\_DOOR and CLOSE\_DOOR. An example of an implementation of this would be a robot  
288    that indicates to a machine that it would like to have a door opened so that the robot could extract  
289    a part from the machine and then asks the machine to close that door once the part has been  
290    removed.

291    When these data items are used to describe a service associated with an *Interface*, they **MUST**  
292    have one of the following two subType elements: REQUEST or RESPONSE. These subType  
293    elements **MUST** be specified to define whether the piece of equipment is functioning as the  
294    *Requester* or *Responder* for the service to be performed. The *Requester* **MUST** specify the  
295    REQUEST subType for the data item and the *Responder* **MUST** specify a corresponding  
296    RESPONSE subType for the data item to enable the coordination between the two pieces of  
297    equipment.

298    These data items and their associated subType provide the basic structure for implementing the  
299    *Interaction Model* for an *Interface*.

300    The table below provides a list of the data items that have been defined to identify the services to  
301    be performed for or by a piece of equipment associated with an *Interface*.

302

303 The table also provides the corresponding transformed *Element Name* for each data item that  
 304 **MAY** be returned by an *MTConnect Agent* as an Event type XML Data Entity in the  
 305 MTConnectStreams XML document. The *Controlled Vocabulary* for each of these data  
 306 items are defined below in *Section 4.2.4.3*.

307

<b>EVENT</b> <b>Data Item Type</b>	<b>Event</b> <i>Element Name</i>	<b>Description</b>
MATERIAL_FEED	MaterialFeed	Service to advance material or feed product to a piece of equipment from a continuous or bulk source.
MATERIAL_CHANGE	MaterialChange	Service to change the type of material or product being loaded or fed to a piece of equipment.
MATERIAL_RETRACT	MaterialRetract	Service to remove or retract material or product.
PART_CHANGE	PartChange	Service to change the part or product associated with a piece of equipment to a different part or product.
MATERIAL_LOAD	MaterialLoad	Service to load a piece of material or product.
MATERIAL_UNLOAD	MaterialUnload	Service to unload a piece of material or product.
OPEN_DOOR	OpenDoor	Service to open a door.
CLOSE_DOOR	CloseDoor	Service to close a door.
OPEN_CHUCK	OpenChuck	Service to open a chuck.
CLOSE_CHUCK	CloseChuck	Service to close a chuck

308

309

310    **4.2.4.3 Event States for Interfaces**

311    For each of the data items above, the *Valid Data Values* for the CDATA that is returned for these  
 312    data items in the MTConnectStreams document is defined by a *Controlled Vocabulary*. This  
 313    *Controlled Vocabulary* represents the state information to be communicated by a piece of  
 314    equipment for the data items defined in the table above.

315    The *Request* portion of the *Interaction Model* for *Interfaces* has four states as defined in the table  
 316    below:

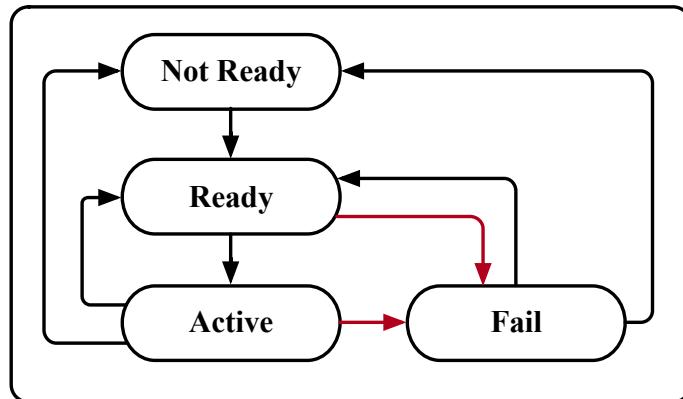

317

Request State	Description
NOT_READY	The <i>Requester</i> is not ready to make a <i>Request</i> .
READY	<p>The <i>Requester</i> is prepared to make a <i>Request</i>, but no <i>Request</i> for service is required.</p> <p>The <i>Requester</i> will transition to ACTIVE when it needs a service to be performed.</p>
ACTIVE	The <i>Requester</i> has initiated a <i>Request</i> for a service and the service has not yet been completed by the <i>Responder</i> .
FAIL	<p>CONDITION 1:</p> <p>When the <i>Requester</i> has detected a failure condition, it indicates to the <i>Responder</i> to either not initiate an action or stop its action before it completes by changing its state to FAIL.</p> <p>CONDITION 2:</p> <p>If the <i>Responder</i> changes its state to FAIL, the <i>Requester</i> <b>MUST</b> change its state to FAIL.</p> <p>ACTIONS:</p> <p>After detecting a failure, the <i>Requester</i> <b>SHOULD NOT</b> change its state to any other value until the <i>Responder</i> has acknowledged the FAIL state by changing its state to FAIL.</p> <p>Once the FAIL state has been acknowledged by the <i>Responder</i>, the <i>Requester</i> may attempt to clear its FAIL state.</p> <p>As part of the attempt to clear the FAIL state, the <i>Requester</i> <b>MUST</b> reset any partial actions that were initiated and attempt to return to a condition where it is again ready to perform a service. If the recovery is successful, the <i>Requester</i> changes its <i>Request</i> state from FAIL to READY. If for some reason the <i>Requester</i> is not again prepared to perform a service, it transitions its state from FAIL to NOT_READY.</p>

318

319

320 The following diagram shows a graphical representation of the possible state transitions for a  
321 *Request*:

322

323

324

325

**Figure 5: Request State Diagram**

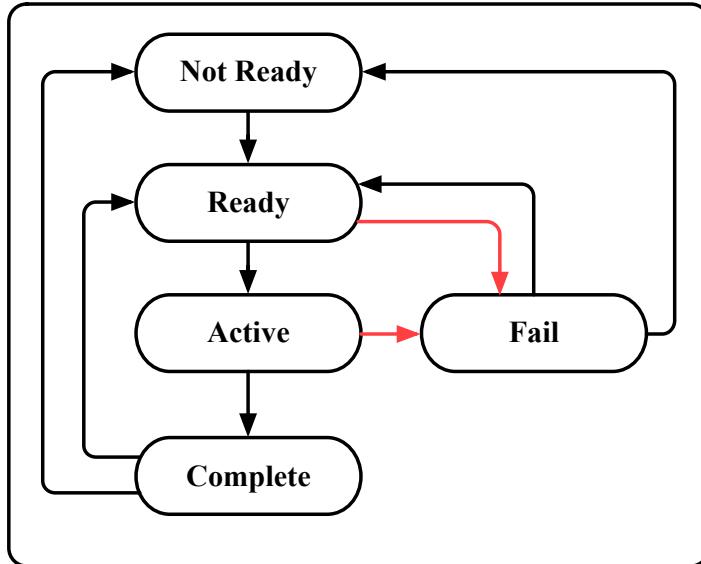

326 The *Response* portion of the *Interaction Model for Interfaces* has five states as defined in the  
 327 table below:

Response State	Description
NOT_READY	The <i>Responder</i> is not ready to perform a service.
READY	<p>The <i>Responder</i> is prepared to react to a <i>Request</i>, but no <i>Request</i> for service has been detected.</p> <p>The <i>Responder</i> <b>MUST</b> transition to <b>ACTIVE</b> to inform the <i>Requester</i> that it has detected and accepted the <i>Request</i> and is in the process of performing the requested service.</p> <p>If the <i>Responder</i> is not ready to perform a <i>Request</i>, it <b>MUST</b> transition to a NOT_READY state.</p>
ACTIVE	<p>The <i>Responder</i> has detected and accepted a <i>Request</i> for a service and is in the process of performing the service, but the service has not yet been completed.</p> <p>In normal operation, the <i>Responder</i> <b>MUST NOT</b> change its state to ACTIVE unless the <i>Requester</i> state is ACTIVE.</p>
FAIL	<p><b>CONDITION 1:</b></p> <p>The <i>Responder</i> has failed while executing the actions required to perform a service and the service has not yet been completed or the <i>Responder</i> has detected that the <i>Requestor</i> has unexpectedly changed state.</p> <p><b>CONDITION 2:</b></p> <p>If the <i>Requester</i> changes its state to FAIL, the <i>Responder</i> <b>MUST</b> change its state to FAIL.</p> <p><b>ACTIONS:</b></p> <p>After entering a FAIL state, the <i>Responder</i> <b>SHOULD NOT</b> change its state to any other value until the <i>Requester</i> has acknowledged the FAIL state by changing its state to FAIL.</p> <p>Once the FAIL state has been acknowledged by the <i>Requester</i>, the <i>Responder</i> may attempt to clear its FAIL state.</p> <p>As part of the attempt to clear the FAIL state, the <i>Responder</i> <b>MUST</b> reset any partial actions that were initiated and attempt to return to a condition where it is again ready to perform a service. If the recovery is successful, the <i>Responder</i> changes its Response state from FAIL to READY. If for some reason the <i>Responder</i> is not again prepared to perform a service, it transitions its state from FAIL to NOT_READY.</p>
COMPLETE	<p>The <i>Responder</i> has completed the actions required to perform the service.</p> <p>The <i>Responder</i> <b>MUST</b> remain in the COMPLETE state until the <i>Requester</i> acknowledges that the service is complete by changing its state to READY.</p> <p>At that point, the <i>Responder</i> <b>MUST</b> change its state to either READY if it is again prepared to perform a service or NOT_READY if it is not prepared to perform a service.</p>

328

329 The state values described in the above tables **MUST** be provided in the CDATA for each of the  
330 *Interface* specific data items provided in the MTConnectStreams document.

331 The following diagram shows a graphical representation of the possible state transitions for a  
332 *Response*:

333

334

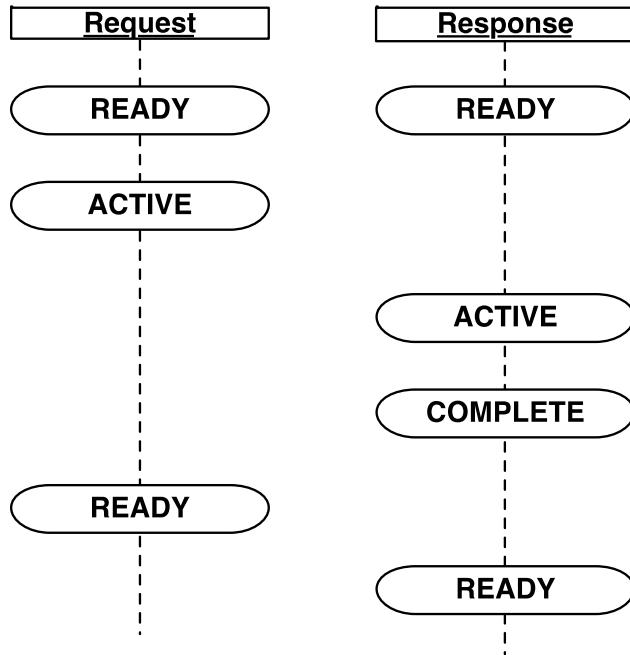

335

**Figure 6: Response State Diagram**

## 336 5 Operation and Error Recovery

337 The *Request/Response* state model implemented for *Interfaces* may also be represented by a  
 338 graphical model. The following scenario demonstrates the state transitions that occur during a  
 339 successful *Request* for service and the resulting *Response* to fulfill that service *Request*.

340

341

342 **Figure 7: Success Scenario**

343

### 344 5.1 Request/Response Failure Handling and Recovery

345 A significant feature of the *Request/Response Interaction Model* is the ability for either piece of  
 346 equipment to detect a failure associated with either the *Request* or *Response* actions. When  
 347 either a failure or unexpected action occurs, the *Request* and the *Response* portion of the  
 348 *Interaction Model* can announce a FAIL state upon detecting a problem. The following are  
 349 graphical models describing multiple scenarios where either the *Requester* or *Responder* detects  
 350 and reacts to a failure. In these examples, either the *Requester* or *Responder* announces the  
 351 detection of a failure by setting either the *Request* or the *Response* state to FAIL.

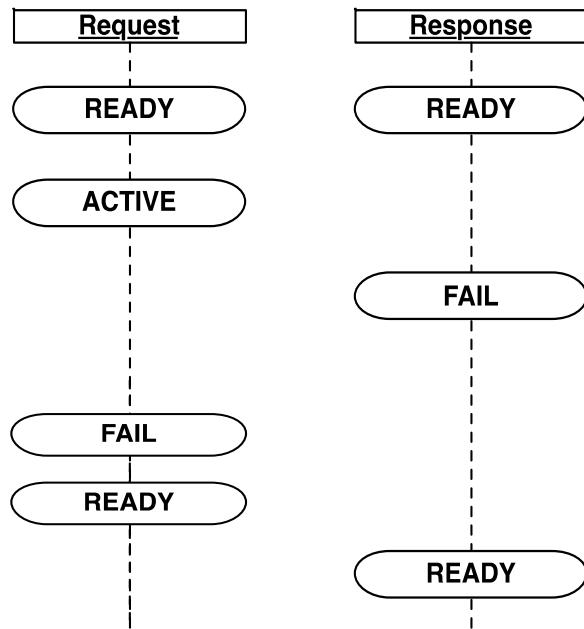

352 Once a failure is detected, the *Interaction Model* provides information from each piece of  
 353 equipment as they attempt to recover from a failure, reset all of their functions associated with  
 354 the *Interface* to their original state, and return to normal operation.

355

356 The following are scenarios that describe how pieces of equipment may react to different types  
 357 of failures and how they indicate when they are again ready to request a service or respond to a  
 358 request for service after recovering from those failures:

359 Scenario #1 – Responder Fails Immediately

360 In this scenario, a failure is detected by the *Responder* immediately after a *Request* for service  
 361 has been initiated by the *Requester*.

362

**Figure 8: Responder – Immediate Failure**

363

364

365 In this case, the *Requester* transitions to ACTIVE and the *Responder* immediately detects a  
 366 failure before it can transition the *Response* state to ACTIVE. When this occurs, the *Responder*  
 367 transitions the *Response* state to FAIL.

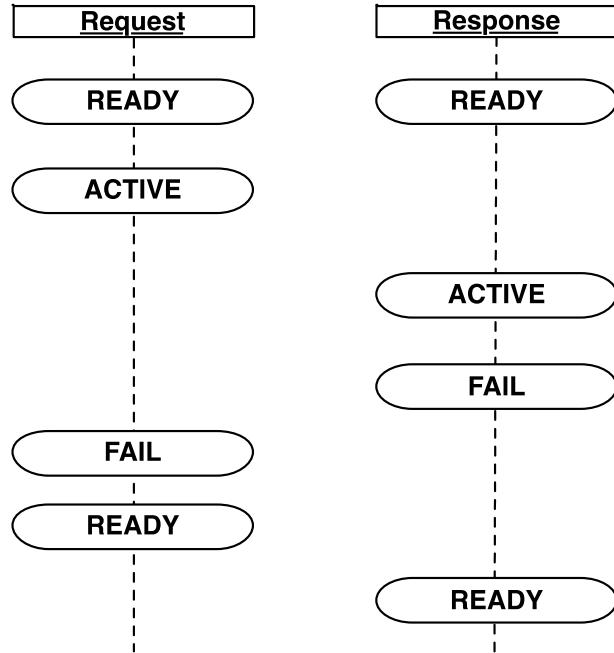

368 After detecting that the *Responder* has transitioned its state to FAIL, the *Requester* **MUST**  
 369 change its state to FAIL.

370 The *Requester*, as part of clearing a failure, resets any partial actions that were initiated and  
 371 attempts to return to a condition where it is again ready to request a service. If the recovery is  
 372 successful, the *Requester* changes its state from FAIL to READY. If for some reason the  
 373 *Requester* cannot return to a condition where it is again ready to request a service, it transitions  
 374 its state from FAIL to NOT\_READY.

375 The *Responder*, as part of clearing a failure, resets any partial actions that were initiated and  
 376 attempts to return to a condition where it is again ready to perform a service. If the recovery is  
 377 successful, the *Responder* changes its *Response* state from FAIL to READY. If for some reason  
 378 the *Responder* is not again prepared to perform a service, it transitions its state from FAIL to  
 379 NOT\_READY.

380 Scenario #2 – Responder Fails While Providing a Service

381 This is the most common failure scenario. In this case, the *Responder* will begin the actions  
 382 required to provide a service. During these actions, the *Responder* detects a failure and  
 383 transitions its *Response* state to FAIL.

384

385 **Figure 9: Responder Fails While Providing a Service**

386

387 When a *Requester* detects a failure of a *Responder*, it transitions its state from ACTIVE to  
 388 FAIL.

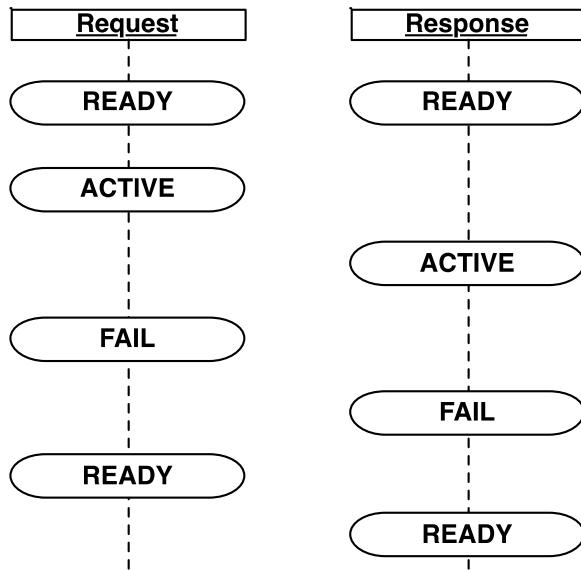

389 The *Requester* resets any partial actions that were initiated and attempts to return to a condition  
 390 where it is again ready to request a service. If the recovery is successful, the *Requester* changes  
 391 its state from FAIL to READY if the failure has been cleared and it is again prepared to request  
 392 another service. If for some reason the *Requester* cannot return to a condition where it is again  
 393 ready to request a service, it transitions its state from FAIL to NOT\_READY.

394 The *Responder*, as part of clearing a failure, resets any partial actions that were initiated and  
 395 attempts to return to a condition where it is again ready to perform a service. If the recovery is  
 396 successful, the *Responder* changes its *Response* state from FAIL to READY if it is again  
 397 prepared to perform a service. If for some reason the *Responder* is not again prepared to  
 398 perform a service, it transitions its state from FAIL to NOT\_READY.

399

400 Scenario #3 – Requester Failure During a Service Request

401 In this scenario, the *Responder* will begin the actions required to provide a service. During  
 402 these actions, the *Requester* detects a failure and transitions its *Request* state to FAIL.

403

404 **Figure 10: Requester Fails During a Service Request**

405

406 When the *Responder* detects that the *Requester* has transitioned its *Request* state to FAIL, the  
 407 *Responder* also transitions its *Response* state to FAIL.

408 The *Requester*, as part of clearing a failure, resets any partial actions that were initiated and  
 409 attempts to return to a condition where it is again ready to request a service. If the recovery is  
 410 successful, the *Requester* changes its state from FAIL to READY. If for some reason the  
 411 *Requester* cannot return to a condition where it is again ready to request a service, it transitions  
 412 its state from FAIL to NOT\_READY.

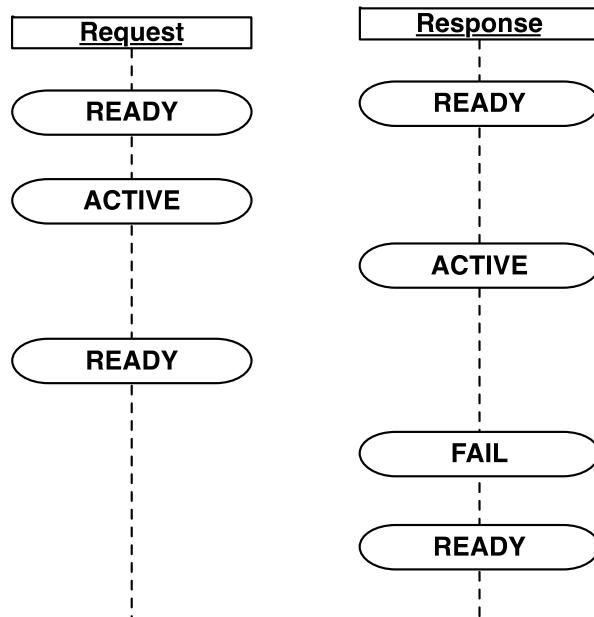

413 The *Responder*, as part of clearing a failure, resets any partial actions that were initiated and  
 414 attempts to return to a condition where it is again ready to perform a service. If the recovery is  
 415 successful, the *Responder* changes its *Response* state from FAIL to READY. If for some reason  
 416 the *Responder* is not again prepared to perform a service, it transitions its state from FAIL to  
 417 NOT\_READY.

418

419 Scenario #4 – *Requester Changes to an Unexpected State While Responder is Providing a*  
 420 *Service*

421 In some cases, a *Requester* may transition to an unexpected state after it has initiated a *Request*  
 422 for service.

423 As demonstrated below, the *Requester* has initiated a *Request* for service and its *Request* state  
 424 has been changed to ACTIVE. The *Responder* begins the actions required to provide the  
 425 service. During these actions, the *Requester* transitions its *Request* state back to READY before  
 426 the *Responder* can complete its actions. This **SHOULD** be regarded as a failure of the  
 427 *Requester*.

428

429 **Figure 11: Requester Makes Unexpected State Change**

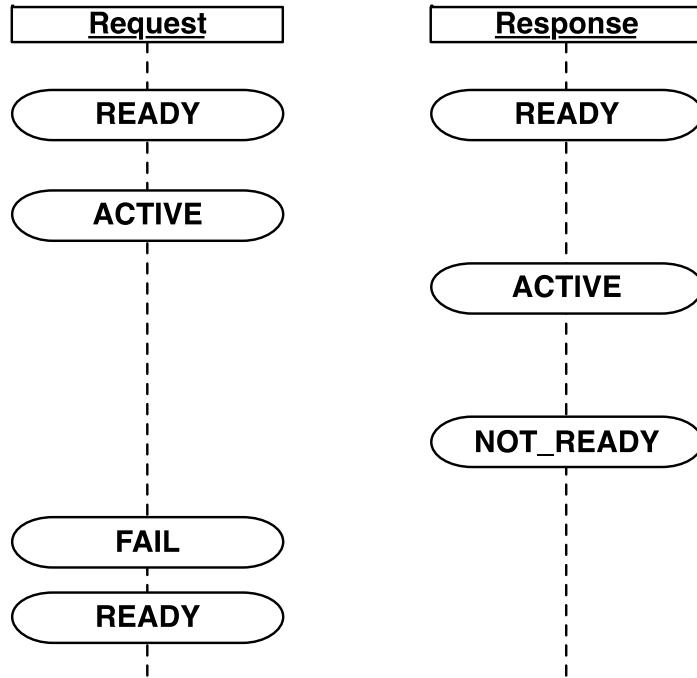

430

431 In this case, the *Responder* reacts to this change of state of the *Requester* in the same way as  
 432 though the *Requester* had transitioned its *Request* state to FAIL (i.e., the same as in Scenario  
 433 #3 above).

434 At this point, the *Responder* then transitions its *Response* state to FAIL.

435 The *Responder* resets any partial actions that were initiated and attempts to return to its original  
 436 condition where it is again ready to perform a service. If the recovery is successful, the  
 437 *Responder* changes its *Response* state from FAIL to READY. If for some reason the *Responder*  
 438 is not again prepared to perform a service, it transitions its state from FAIL to NOT\_READY.

439 Note: The same scenario exists if the *Requester* transitions its *Request* state to NOT\_READY.  
 440 However, in this case, the *Requester* then transitions its *Request* state to READY after it  
 441 resets all of its functions back to a condition where it is again prepared to make a  
 442 *Request* for service.

443 Scenario #5 – Responder Changes to an Unexpected State While Providing a Service444 Similar to Scenario #5, a *Responder* may transition to an unexpected state while providing a  
445 service.446 As demonstrated below, the *Responder* is performing the actions to provide a service and the  
447 *Response* state is ACTIVE. During these actions, the *Responder* transitions its state to  
448 NOT\_READY before completing its actions. This should be regarded as a failure of the  
449 *Responder*.

450

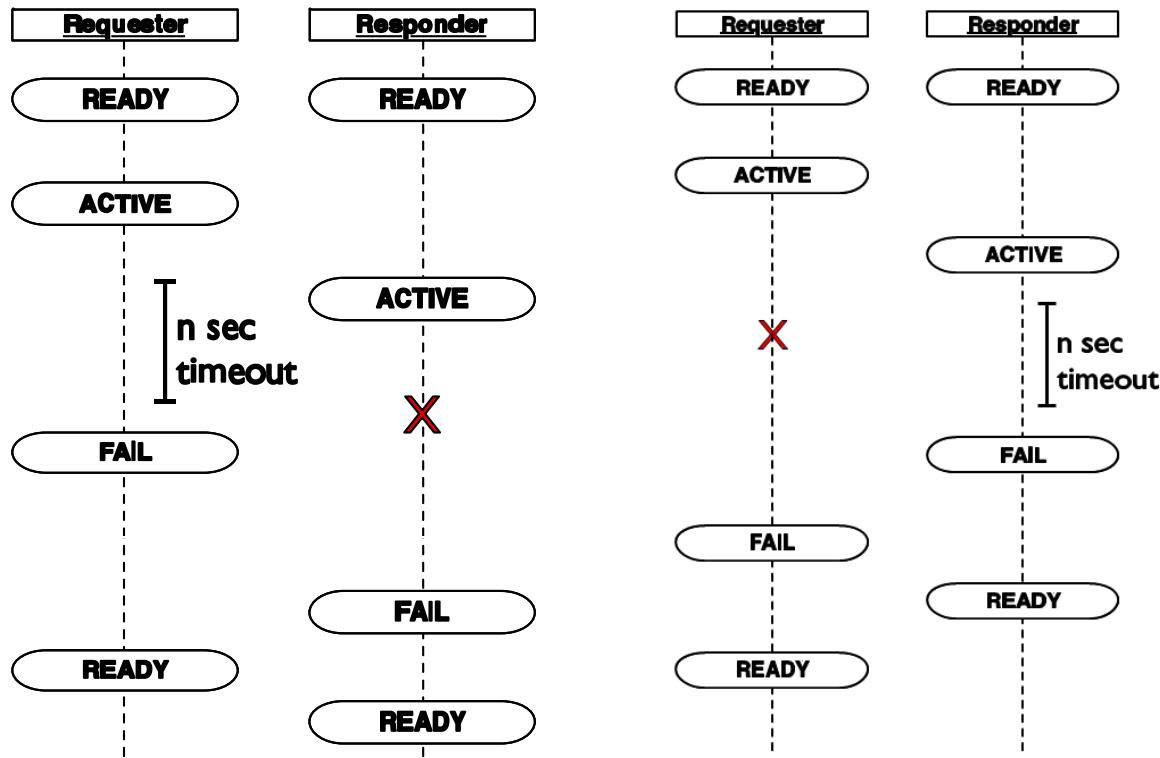

451 **Figure 12: Responder Makes Unexpected State Change**

452

453 Upon detecting an unexpected state change of the *Responder*, the *Requester* transitions its state  
454 to FAIL.455 The *Requester* resets any partial actions that were initiated and attempts to return to a condition  
456 where it is again ready to request a service. If the recovery is successful, the *Requester* changes  
457 its state from FAIL to READY. If for some reason the *Requester* cannot return to a condition  
458 where it is again ready to request a service, it transitions its state from FAIL to NOT\_READY.459 Since the *Responder* has failed to an invalid state, the condition of the *Responder* is unknown.  
460 Where possible, the *Responder* should try to reset to an initial state.461 The *Responder*, as part of clearing the cause for the change to the unexpected state, should  
462 attempt to reset any partial actions that were initiated and then return to a condition where it is  
463 again ready to perform a service. If the recovery is successful, the *Responder* changes its  
464 *Response* state from the unexpected state to READY. If for some reason the *Responder* is not  
465 again prepared to perform a service, it maintains its state as NOT\_READY.

466 Scenario #6 – *Responder or Requester Become UNAVAILABLE or Experience a Loss of*  
 467 *Communications*

468 In this scenario, a failure occurs in the communications connection between the *Responder* and  
 469 *Requester*. This failure may result from the `InterfaceState` from either piece of  
 470 equipment returning a value of `UNAVAILABLE` or one of the pieces of equipment does not  
 471 provide a heartbeat within the desired amount of time (See *Part 1.0 - Overview and*  
 472 *Functionality* for details on heartbeat).

473  
 474 **Figure 13: Requester/Responder Communication Failures**  
 475

476 When one of these situations occurs, each piece of equipment assumes that there has been a  
 477 failure of the other piece of equipment.

478 When normal communications are re-established, neither piece of equipment should assume  
 479 that the *Request/Response* state of the other piece of equipment remains valid. Both pieces of  
 480 equipment should set their state to FAIL.

481 The *Requester*, as part of clearing its FAIL state, resets any partial actions that were initiated  
 482 and attempts to return to a condition where it is again ready to request a service. If the recovery  
 483 is successful, the *Requester* changes its state from FAIL to READY. If for some reason the  
 484 *Requester* cannot return to a condition where it is again ready to request a service, it transitions  
 485 its state from FAIL to NOT\_READY.

486

487 The *Responder*, as part of clearing its FAIL state, resets any partial actions that were initiated  
488 and attempts to return to a condition where it is again ready to perform a service. If the  
489 recovery is successful, the *Responder* changes its *Response* state from FAIL to READY. If for  
490 some reason the *Responder* is not again prepared to perform a service, it transitions its state  
491 from FAIL to NOT\_READY.

506 controllers – Part 11: Process data for milling. Geneva, Switzerland, 2000.
- 507 5. International Organization for Standardization. *ISO 6983/1* – Numerical Control of  
508 machines – Program format and definition of address words – Part 1: Data format for  
509 positioning, line and contouring control systems. Geneva, Switzerland, 1982.
- 510 6. Electronic Industries Association. *ANSI/EIA-494-B-1992*, 32 Bit Binary CL (BCL) and 7  
511 Bit ASCII CL (ACL) Exchange Input Format for Numerically Controlled Machines.  
512 Washington, D.C. 1992.
- 513 7. National Aerospace Standard. *Uniform Cutting Tests* - NAS Series: Metal Cutting  
514 Equipment Specifications. Washington, D.C. 1969.
- 515 8. International Organization for Standardization. *ISO 10303-11*: 1994, Industrial  
516 automation systems and integration Product data representation and exchange Part 11:  
517 Description methods: The EXPRESS language reference manual. Geneva, Switzerland,  
518 1994.
- 519 9. International Organization for Standardization. *ISO 10303-21*: 1996, Industrial  
520 automation systems and integration -- Product data representation and exchange -- Part  
521 21: Implementation methods: Clear text encoding of the exchange structure. Geneva,  
522 Switzerland, 1996.
- 523 10. H.L. Horton, F.D. Jones, and E. Oberg. *Machinery's handbook*. Industrial Press, Inc. New  
524 York, 1984.
- 525 11. International Organization for Standardization. *ISO 841-2001: Industrial automation  
526 systems and integration - Numerical control of machines - Coordinate systems and  
527 motion nomenclature*. Geneva, Switzerland, 2001.

- 528        12. ASME B5.57: *Methods for Performance Evaluation of Computer Numerically Controlled*  
529            *Lathes and Turning Centers*, 1998
- 530        13. ASME/ANSI B5.54: *Methods for Performance Evaluation of Computer Numerically*  
531            *Controlled Machining Centers*. 2005.
- 532        14. OPC Foundation. *OPC Unified Architecture Specification, Part 1: Concepts Version 1.00*.  
533            July 28, 2006.
- 534        15. IEEE STD 1451.0-2007, *Standard for a Smart Transducer Interface for Sensors and*  
535            *Actuators – Common Functions, Communication Protocols, and Transducer Electronic*  
536            *Data Sheet (TEDS) Formats*, IEEE Instrumentation and Measurement Society, TC-9, The  
537            Institute of Electrical and Electronics Engineers, Inc., New York, N.Y. 10016, SH99684,  
538            October 5, 2007.
- 539        16. IEEE STD 1451.4-1994, *Standard for a Smart Transducer Interface for Sensors and*  
540            *Actuators – Mixed-Mode Communication Protocols and Transducer Electronic Data*  
541            *Sheet (TEDS) Formats*, IEEE Instrumentation and Measurement Society, TC-9, The  
542            Institute of Electrical and Electronics Engineers, Inc., New York, N.Y. 10016, SH95225,  
543            December 15, 2004.
